Oops!

Anyway, some quick words about the FAQs.

- Yes the Vendors list was previously posted only a month ago. But earlier this year the auto-FAQ poster I use stopped for a while, then burped out everything at once. So the last several cycles the two FAQs got posted at the same time, at two-month intervals. I've just "force" posted the Vendors FAQ, which should now put the two files on alternating two-month posting intervals as in the past.

- www.faqs.org has been dormant since earlier this year. I don't know what's up; the FAQ-maintainers list I'm on also originates from there, so I suspect it's down too. So the copies of my FAQs there are now old.

Some other Usenet FAQ archives are still working. One I know is:
http://www.cs.uu.nl/cgi-bin/faqwais
Current versions of faqs for this newsgroup:
http://www.cs.uu.nl/wais/html/na-bng/comp.sys.atari.8bit.html
I may update the Welcome FAQ with this info if faqs.org stays broken.

- I don't believe I mentioned: As of a couple months ago, EVERY entry in the Vendors FAQ has been verified recently (since 2002). The last of the "almost certainly obsolete" information, some of which was in there since I originally pulled the list together about 11 years ago, has been sifted out. So if there are people who have always ignored the list because of the stuff in it you knew was outdated, hopefully you have less of that reason now! ALL entries now indicate the date that the information was last verified.

Thanks!

-Michael

snip...

I temporarily put a 12 volt jack on the +12 and gnd lines(disconnecting the line to the computer)
in my AVB. I found that the AVB worked in the XL, though not very well. I found that if the voltage
is above 13, the avb is unreliable, so I switched to 9 volts(it put out 12) and it was o.k. Same for the 800,
though it is specified to put out 11.88 volts on the 12 volt line. So its close enough.

Also, the XL put out more noise when the avb isn't speaking than the 800. Probably due to differences in the
audio circuit. Neither turned off completely.

I will pull together parts for the voltage multiplier. The avb only needed 20 ma. The multiplier will handle 100 ma at 5 volts I think.

Rick D.

3366. Re: XEP80 and Amiga 1084?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-01 14:16:07 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041001101607.22480.00000057@mb-m06.aol.com>
Source record: 14473

I hooked up an XEP80 to a friend's 1084 monitor. To my surprise, the first display line was cut off, with maybe 2/3 of it (vertically) being visible. The vertical size and position controls had plenty of adjustment to spare, but no matter how I adjusted the settings, the first line remained cut off. There was plenty of room, I'd say, for the 25th line. Incidently, this was in composite mode. I had planned on connecting to TTL, also, but was not prepared for the round Din connectors on this monitor.

Two other folks have said that their XEP80's did fine with their Amiga monitors.
I was planning on buying a 1084/1902, but probably don't want one if only some of them will function properly with the XEP80.

Can anyone shed any light on this? Does this particular monitor perhaps need an internal adjustment? (I am aware of the high voltage safety issues inside a CRT type TV or Monitor.)

Thanks,
Larry

Well,
in a german Action! magazine there was a version of a talking Eliza. It used (maybe copyrighted) parts of the SAM software. I do not remember right now, if Eliza was speaking german or english there - but as always, I do have this program (somewhere) in my collection. So all you have to do is write me an e-mail and a few days later you will get a copy of that program (of course I also have various Eliza versions in german/english without speech synthesis)... greetings, Andreas.

On Sourceforge You will find DOSBOX which runs fine on XP and the Bochs machine
which can emulate a PC on many OSses. On that emulated PC You can easily install any flavour of DOS You prefer. Both programs written by verry clever people imho (no, I am not one of the, far from that, my admiration is sincere).

Good luck!
Rene
P.S. And 4DOS is not a full DOS, it is a highly improved "command.com".

Message-ID: <X8z7d.10158$WW4.181647@news4.e.nsc.no>
Source record: 14483

I am looking for a Black Box. I can use more HD's on that than the MIO or am I mistaken? I have MIO 1Mb and 256Kb and the Adaptec adapter. I used to work okay, but I cannot format the HD's anymore (ST225 and a couple of others). I think I heard the BB could use more SCSI drives. I have a 2Gb SCSI drive I hope to use. Anybody know where to get more info and where to buy one? Would be nice to have the floppy adaptor too.

Thanks for any help!

Take Atarian care

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I could do that if I wanted soulless games. I do have a PC and all it's good for is a few games. Playstation sucks big time, I rather use my DC, GC or Jaguar or Saturn or ... or ... I do have PSX, PS2, but can't say that there's many good games on them. They all have a few, but compare Burnout on GC and PS2, you should see what I mean.

Sorry for feeding this troll, but couldn't resist.

I know you guys don't like 'feeding trolls' but i have to set something
straight.

I like playstation games and the like... (ever play Ratchet&Clank 1 or 2?
Great game!)

But I also like the older games. True they may not have the 3d graphics and
digital sound, but still, some of the older games still are as addictive as
the newer ones... (Mario Bros 3 on the nes for instance... One of the best
games ever i would think, simple gfx, but great gamemplay, and on an 8 Bit
system no less!)

Ok i think i've put my point across. And I hope mr 'Kaiser Sun' gets that
bug out of his butt about hating old systems...

Sincerely,

Jonathan Herr

If you speak about 32 bit XP, is not command prompt of XP already DOS
that runs on XP? You can start the most of DOS programs except:

1) Programs that directly access hardware (usualy LPT ports, sound
cards, disks). However, direct access to video memory, keyboard, COM
ports and PC speaker is generally O.K.

2) Timing dependant programs. Preemtive multitasking has penalty that
no such program can cope with. Try BEEP 10,0 on any Spectrum emulator
for DOS running under NT/2000/XP. The tone will be harsh.

3) Programs that use special memory extenders. Conventional memory is
well emulated, but extended memory often conflicts with XP.

For kind 1) there are some solutions, like VDMSOUND and similar
programs. Kind of problem 3) is solvable with different version of the
extender (which BTW, are not part of the DOS). And no DOS emulator can
solve problem 2) anyway.

But 64 bit XP can not start DOS programs at all.

Just get a small square of felt about the same thickness and cut out or punch
out a little
circle of the right size. Fix it there with some super glue (cyanoacrylate).

Steve

3387. RISC-based Atari Transputer and Polyhedra box?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-05 07:08:00 UTC
From: mstepansky@aol.com
Message-ID: <20041005030800.22383.00001526@mb-m17.aol.com>
Source record: 14494

I remember Atari Sam Tramiel or their famed engineer (Shiviji Shriaz?) almost chose to use...

Motorola 88000 processor, which would have been their first RISC-based processor for their computer in 1988 or 1989.

But they end up choosing InMOS-T1, transputer for parallel processors in their rare ATW worsktation or Abaq.

I personally have tried and seen ATW running in parallel with several heavy-duty applications (ray tracings, bouncing demos, other demos) simulataneously in its parallism fashion. It was shown in SIGGRAPH 89 (Boston).

Cool-wow-wow factor was very high at that time, when they had SGI/Alias booth nearby it, running SGI Personal Iris 4D/box. :o)

ATW had 4 transputers (Inmos T-1 CPU) in a single farmcard. At the time, it speed rating was 40 MIPS (10 mips per Inmos). It can go up to 400 MIPS using Atari Polyhedra farmcard expansion box of some sort, back in 1990.

400 MIPS was the speed capacity similiar to Pixar Image Computer (the stuff they use to render out Luxo Jr. anim).

Anyone know about Polyhedra? Sounds rare item if seen in ebay.

Mike

Define 'real' as in 'real games' pls.

SGI Onyx3000 supercomputer with 127 cpus at 250Mhz R10000 each is the
equivalent of 112 Ghz power. Now that's realtime stuff. :o)

250Mhz is about 3.5 times as fast as Pentium3 processor (I think).

so 128 cpus x 250 mhz x 3.5 (for equiv factor) = 112 Ghz.

Viola! Ebay had it there recently - no one bid it $9,999.

From: mstepansky@aol.com
Message-ID: <20041005032122.22383.00001530@mb-m17.aol.com>
Source record: 14398

De Re Atari manual is the MUST have (hard to find, rare) manual for Atari graphics programmers, etc. I still have one. :o)

It covers P/M graphics, Display List Interupt/DLI (how to get more colors on screen), more colors per player missles via DLI; fine horizonal/vertical scroll memory map, screen memory map, audio stuffs, math library package in ROM routines calls, Character Set Mapping, etc etc etc.

its is about 1-2 inches high of pages.

fun to use 6502 assembly language - feels like you have the power to control its processor nicely.

Mike

At the time of its release there was limited info for the public
(hobbyists hackers), so it was a pretty good manual. It's not really
a reference -- it's more of an explanation of "You Could Do This Using
That Atari Feature" written by the programmers who wrote commercial
software for the Ataris. Now, with all the 8-bit docs that have been
produced since and made available online De Re Atari is more of a
curiosity -- something interesting to read -- than really useful
documentation.

I don't know about XP, but I have an EPROM burner (EMP-20) which barely
works under 2K. To let it access the parallel port, in addition to
having to install a driver, you must run its DOS program in "full-
screen" mode. To get in and out of full-screen mode, you have to type
ALT-ENTER, but you can set the program to start in full-screen mode.

Whoever's crazy idea it was to allow direct access to I/O ports based on
the screen display mode should be shot.

> program in use now (only a different version?) ?

The old chat site was run on pearl script on a linux box that was placed
under a desk and forgotten. :) Ran for months without maintenance. A true
tribute to my friend's tinkering.

The chat script was originally used by AUNT.

The main beauty of the AUNT/JYBOLAC chat sites was the simplicity of it
all. It was simple enough that you could telnet to it and hit it with a lynx
browser with the Atari 800 for example. :)

Now if anyone can tell me of a chat site that currently does that, I will
hang up my chat site hosting forever.

However, in the meantime, my friend and I are working on a even simplier
chat site. This will be great especially with the upcoming ethernet abilities
of the 8-bit Atari and Contiki. :)

Again, if a site currently does this, I will hang my hat and work on
something else. :)

Later!

Doctor Clu

I have an inkling about who that was... About Your EPROM burner problem, why
don't You make a multiboot system with DOS? Or even just a small
non-bootable FAT16 partition with Your burner software and a bootable
diskette?

Greetings,
Rene

In XP there's a registry entry that tells XP to keep away from the LPT port.
I had to set it to use my BDM-MultiLink module on the LPT port.

> Adding to my list...
>

Thinking about this... I played a bit with the idea of a 80 column mode
in the ++ emulator, but there's one constructional detail that troubles
me and makes this all but easy: The emulator always "thinks" in
half-color clocks because that's the building-stone of GTIA/Antic
timing, but I can no longer do that in the XEP 80. This means that either

o) I've to double cycles in the GTIA, thus doubling the memory traffic,
and thus disallowing the practical x3 magnification modes

or

o) using a separate window (not really nice)

or

o) using an ugly 4xsomething character set to fit into the screen.

My first idea was to use some kind of overlay (half-transparent XEP 80
on top) but that doesn't really fit. The next idea to use the "terminal"
window and "ncurses" for an E: emulator, but that doesn't work well for
win32 since there's no fully working ncurses there (pdcurses has some
glitches).

Well, any ideas?

So long,
Thomas

using a seperate window would sort of keep in the spirit of the
hardware (since you needed to plug it into a monochrome monitor).
I dont think it would be that much of a big deal since it would mainly
used for curiosity (how many software programs were written for the
XEP80 anyway?)

How does the 800 version of the MyIDE access the hardware? On the XL/XE versions it is either D500, or D100.

I'm wondering because I wrote an image manager for the MyIDE hardware, but I don't think it will work on the 800, but AFAIK you are the only person who has one. ;)

from your pov now, but in reality he made commodore into a big player
in the 70's early 80's and took a decimated atari and did well at
first, streamlining it down and making profitable, but in the long run
could follow the trends of the computer/videogame market properly.

From: richbon@mailblocks.com
Message-ID: <a134b44b.0410060939.a84fa36@posting.google.com>
Source record: 14422

Hi All...

I read the FAQ and searched the Archives, but everything I saw tended to be older discussions on the subject, so I thought I would pose this question again and ask if anyone had any thoughts on the matter. Here's the situation:

* I have two shoeboxes full of double-sided single-density Atari discs that I rescued out of my parents' attic. (Double-sided in the sense that the extra write-notch was cut, and the discs were all flipped and had their second side used as well.)

* These discs were (I believe) originally written on an 810 floppy drive with a Happy board installed.

* I have (as a test bench machine) a Pentium 100 running MS-DOS 6.22 with a 1.44mb high-density floppy drive.

* In my parents' attic, they still have the original Atari 810 floppy drive (w/Happy) and the Atari 130XE computer it was hooked up to. Both were in working order when we put them up there a decade ago and have not been touched.

Ideally, I would like to do the conversion directly on the PC, but the general sense I've gotten from the archives and the FAQ is that there is no way to get a single-density disc to read in a 1.44mb drive. Does anyone have any technique that would allow this?

Since I still have access to the original 810, I could try building the Xformer cable as described at:
http://www.emulators.com/xformer.htm#CABLE
But that's sort of a last resort at this point, because I'd have to go to the 'rents and rescue the old 810 from the attic.

Any help or advice would be much appreciated.

-Rich

At this point, I'm working with the hotkey-switchable idea from the previous post. I actually have separate memory allocated for the XEP80 from the "regular" screen so both displays can be kept in tact and switched back and forth. The display for XEP80 follows the same rules for sizing multiplication as set for the general display (yes, x2 is about as large as practical). This implementation is working pretty well and should provide the flexibility to extend to a dual-windowed display at some point in the future. I actually made some really good progress yesterday, and I will have a link to a screen or two quite soon (depends on how much longer it takes me to get the character set and handling for a couple basic commands put in) for to offer up for feedback.

Also - here's something to think about... Because the XEP80 display is 560 x 250, the pixel by pixel representation on a computer monitor is quite elongated, so it's much differently proportioned than the output on a composite monitor. Would it make sense to go ahead and double the vertical to compensate and get closer to a typical 4:3 ratio (or maybe at least provide that option)?

Did Jack Tramiel screw Atari? In my opinion he did not. Had Tramiel not
pushed the development of the ST series Atari would have died much sooner
than it did.

Well, reading Atari disks with a PC is not an easy task.

If the disks were formatted in single density (90k, the only format
a stock 810 could do), chances are next to nothing that you'll be
able to read them - the PC floppy controlles just don't support
this format.

In case you used double density (180k, don't know if the happy board
supports this density), chances are a little better. The PC floppy
controller supports this format, but several disk drives and/or
controllers have trouble reading a disk formatted in an Atari drive.

You could try WriteAtr from my homepage:
http://www.horus.com/~hias/atari/

WriteAtr also supports enhanced density (130k, the standard format
of the 1050) but this doesn't work with every controller.

If it can't do the job you could try the other methods listed in
the FAQ (Anadisk etc.)

> Since I still have access to the original 810, I could try building
> the Xformer cable as described at:

I'd recommend buying/building either an SIO2PC or a 1050-2-PC cable.
Almost no software (except Xformer :-) supports the Xformer-cable,
but there are quite some programs supporting the SIO2PC cable.

so long,

Hias

I am afraid that there is no nondestructive technique that would allow squeezing the 5.25 disks to fit in the 1.44 MiB drives. ;-) Even if you had the 1.2MiB drive in the pc, you would have problems reading the single-density format. Possible solution is to have a fully programmable floppy controller like the "catweasel". Yet even this one has _yet_ no software support for the Atari's single-density format.

As they say: "We need documentation and sample floppies! You need patience :-("

Unless you want to help in the catweasel software development, digging out your 810 is probably the way to go. Once you get the drive, the Atari and e.g. the SIO2PC cable connected - the rest is a breeze. I use the great atarisio for Linux with 100% satisfaction.

Yeah, after reading yet more webpages and archives, I've come to the conclusion that the only way to go is build one of those 1050-2-PC cables. Time to drag the 810 out of retirement.

Out of curiosity, how reliable should I expect these disks to be? To give an idea of what they've been through - they've spent the last ten years in my parents' attic in New Jersey. Pretty hot in the summer, pretty cold in the winter. Most of them were packed reasonably tightly, standing upright in shoeboxes. Visually inspecting the discs shows no visible warping or anything like that.

Am I going to build the cable and get a whole lot of nothing, or have people generally had a good experience with retreiving data from old discs? I'm pretty sure I've got a bunch of software on those discs that doesn't appear in any of the internet archives. (or at least not that I've seen)

As the previous replies have stated your best bet is to buy a SIO2PC /
10502PC cable which allows you to hook your computer and your disk drive,
respectively to your PC.

10502PC allows you (with appropriate software) to hook your disk drive to
your PC to make ATR images of the disks.

SIO2PC allows your PC to emulate attached disk drives with your original
Atari hardware.

Go here:
http://www.atarimax.com/sio2pc/

for a combination 10502PC/SIO2PC adapter... excellent value for the price,
works great. I don't know if it will work with an 810 Happy, but my 1050
Happy worked fine with it in "slow" mode. The documentation says it will
work with the 810 drive.

http://www.atarimax.com/

Also has the APE/ProSystem software to use these cables to transfer data
to/from your Atari from your PC acting as attached Atari disk drives.

Couldn't follow trends? Let's see, major trends...

PC clones... he did that. PC1, Portfolio, etc.

Made a computer that hit a nitch market (Midi), check...

The only reason why IBM platform computers are around and hardly anyone
else aside from Mac are not is due to third party companies making
hardware.

Here in Dallas for example, there was a company named DataStitch that were
using Atari TT030's for their business. The ONLY reason they did not stay
with them was due to the fact they couldn't get the TT030 fast enough.
They had to choose another platform.

If you ask me, if IBM had not had their platform STOLEN basically, and
made by others, they would probably be left in history like so many other
platforms. The fact that the IBM platform is still with us and prominent
is a fluke in my opinion.

Before building/buying the cable dig your Atari out and check your disks with it. I think the chances for almost ful recovery are pretty good. But if you cant read the disks using working Atari computer and disk drive then there is no chance 1050-2-PC or SIO2PC could help you.

I only say that he/his family 'Ultimately' screwed Atari because,
whatever Atari were developing or selling (Post A8), there was nothing
behind it.. i.e limited future devlopmental/design capability, non
existant h/w or s/w support internally and support for external
developers, no cohesive or consistant sales/marketing models, and
lastly any s/w support that they were getting, tramiel and his family
were screwing the s/w devlopers as well, always kept Atari in a VERY
small market, instead of the mainstream market,

Huh, there was just a thread on the c.s.c about that kind of questions ;-)

http://tinyurl.com/46bat

>
> Am I going to build the cable and get a whole lot of nothing, or have
> people generally had a good experience with retreiving data from old
> discs?

The odds are with you. But (as another poster suggested) if you dig out
the computer along with the drive you may check your disks before you
start fighting with soldering iron. Also with the computer at hand you
may build an easier (SIO2PC) instead of 1050-2-PC cable.

> I'm pretty sure I've got a bunch of software on those discs

I suggest an APE/SIO2PC/PRO interface from Steve Tucker.
Steve (atarimax) has the interfaces on eBay for starting price $25 plus $5 ship. It is an excellent interface. Search for SIO2PC. Amazingly, Steve didn't put APE in his description. This includes a serial cable to connect from interface to PC.
You have a big task salvaging those disks. Probably some are copy protected disks, in which case only a PRO image can be made, a normal ATR can't be made. You would need APE software, or SIO2PC software. There are some limitations to the shareware APE software if not registered and I think Atari->PC copying is one of those limitations. I survive quite well with the DOS APE 1.18, registered, even in a windows environment.
I know this is a advocacy for APE, it is what I use. You can learn more about APE at www.atarimax.com The site doesn't have the APE/PRO interface that I'm suggesting, you have to go to eBay for that.
Your 810 and 130XE will have to be working to salvage those disks. You'll probably want to make ATR images of the disks, rather than copy file by file. Then you can access files with xdir or imageman (PC programs for managing ATR files).
Regards

I would think that the heat would be the greatest detriment to the disks
data. I retrieved data from disks (470 sides) without any losses of data
or non-readability. Time of storage was about 20 years but the care in
storage was high (avoiding high temperatures or any large variance as well
as exposure to light).

So you you have at least a reasonable expectation of reading them reliably.

I know you don't but if you asked me... that crap was obsolete,
underpowered and heavily misdesigned from the day one. Remnants of this
heritage are still there today, albeit not that many anymore.

If you dont mind me asking, what type of software is on the disks? If it is nothing you persnally created then the reliability of those disks does not matter, since you can download almost every stitch of 8bit software ever released commercially, public domain, freeware or shareware in the US and Europe off the net in ATR form. Once you had the Sio 2 PC cable you could easily replace any of the disks you had as a kid.

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Hardware, Games/ Software, Books and Accessories! Classic Atari 8 Bit and Atari ST Computers Plus Atari Jaguar Games! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!!! http://www.aracnet.com/~atari/catalogs.html Click Here to Save!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

> Did Jack Tramiel screw Atari? In my opinion he did not.

C64 fans got the C128 -- a faster machine with a real 80 column
display.
Jack gave us Atari 8-bitters the 130XE -- an 800XL with an extra 64K
-- whoopie floggin' doo -- and the Atari 8-bit 80 column "enhancement"
amounts to a $%*&-ing external green screen terminal. Jack T screwed
us 8-bitters with another cost reduced, reliability impaired, cheaper
is better, disposable computer in his long history of such things.

Commodore continued making and selling its 8-bits longer than Atari.
Commodore would have been in a much better financial position if it
wasn't for Jack T having had screwed Commodore by wasting unimaginable
piles of money to fill warehouses with obsolete computers that
Commodore later had to dump at a huge loss after they kicked him out.

> Had Tramiel not
> pushed the development of the ST series Atari would have died much sooner
> than it did.

An Atari selling junk was no better than a dead Atari.

Atari 8-bitters recognized the Amiga Lorraine as the next generation
Atari (or the generation after that) before Commdore ever got their
hands on it.

After the 16-bit systems that everyone expected from Commodore and
Atari suddenly got up and switched places then the logo on the case
became more important than the hardware inside the box. It was almost
stomach wrenching to watch the Atari magazines that previously fawned
over the Amiga commit intellectual suicide to justify the superiority
of ST -- a 68000 system running a kind of DOS with a limited GUI,
limited graphics, and limited expansion.

The good part of the ST is that Jack didn't get the opportunity to
vandalize the Amiga. Had Jack been able to get his hands on the Amiga
just imagine the terrible nightmare of an Amiga horribly crippled and
packaged like the ST.

Where Atari died at the hands of Jack T and his ST, the Amiga survived the demise of Commodore. The Amiga continues to exist -- there is an Amiga corporate entity, development continues on the Amiga OS, and there are PPC systems based on the Amiga OS design and capable of running classic 68000 software.

I think that a more realistic test is to expose the disks to the more
extreme temperatures as was done, but to WAIT until they have
reacclimated to room temp to try and use them again.

If the new interface is so great (and it sure looks the part!), I
wonder how come it isn't touted as a good companion to the APE
software on Steve's site.

I bought APE and the older version of his cables. I rather fancy the
new all in one interface you mention now though.

Ok, you can use a XF551 and util to do the job, i use win 98 and a 1.2
51/4
epson drive without problem, the only drawback is that i have to use
the native
dos mode, i mean i use f8 when booting the system and from there i go
to dos. For me it if flawless, i recentry upgraded my 1050 to happy so
i will test if it works like the xf but i doubt it.

>Buy a PC or a Playstation if you want to play REAL games!

What stupid statement. Just what is a REAL game? The PC and Playstation are fine for games (BTW the Xbox is MUCH better than the Playstation), but the Atari computers offer some nice gaming experiences. I would assume you judge a game by the graphics and sound, but the real thing to look at is the gameplay. I have looked at and played many PC and Playstation games and they such. Now the same goes for some Atari games also. Gameplay is the important thing and many many Atari games have that. The 8-bit computers have tons of good classic games that will never lose their appeal. If that were the case, then there would not be any 8-bit emulators for the Mac and PC.

I think you need to get A.P.E.. I have something similar for my
Atari ST/Hades and I was able to make disk images of some of my
Atari 5.24" disks, so I could use them in an 810 emulator.

3454. Free 800XL system, you pick up:

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-08 17:39:03 UTC
From: martianman597@wmconnect.com
Message-ID: <20041008133903.01015.00001704@mb-m15.wmconnect.com>
Source record: 14361

I have an old 800XL system in good working order that will go to the first person who'll come and get it. I will NOT ship this system, so don't ask.

It consists of my 800XL w/PSU, a homemade A/V cable, a few cartridges (MyDOS 4.53/4 is one of them if I got the version right), two joysticks (one working, one not), a joystick extension cable, an XF551 drive with data cable & PSU, 8 boxes (10 each) of new DSDD 5.25" floppies, hundreds of old 5.25" disks (all will need formatting) and I may even throw in my old C=1702 monitor w/stand (not sure yet).

Last I checked, everything worked fine but it's been awhile.

I live in Central California in the San Joaquin Valley (between Fresno & Bakersfield). Heck, I'll even drop it off if you're close.

E-mail me here if interested. Thanks.

Darn - I could use the XF551 and the cartridges. If you happen to not get takers for everything and would ship a few items for payment, drop me a line. Otherwise, consider me "not asking". :)

Howdy folks

> A neat box. Perhaps the most expensive solution, but most versatile
with
> the CD interfaces, SCSI, printer buffers... I mean really neat.

Lemme see, I have on my BlackBox's SCSI bus:

- one 80MB Harddrive
- one ZIP100 drive
- one 12 speed CD ROM player
- one 32 speed CD ROM player
- one 40/24/10 (I guess) CD Burner (no I haven't tried to burn anything yet,
it developed an inballance why the postal service had it and the drawer
won't shut under software command yet.)
- one DVD ROM player. (yes, I have looked at a DVD's directory on my 65XE)

That makes 6 (yes: SIX) SCSI devices. As soon as I find a new tower and
have installed all this stuff I'll put a picture of it on my new site.

CU Mathy van Nisselroy

PS I need this stuff for testing my CD/DVD software. See my site at
www.mathyvannisselroy.nl

That would be a MaxFlash Cartridge (http://www.atarimax.com/flashcart/)
with the program on it, not an orginal cartridge. But much better, since
you can flash any other software on it you want and have any cartridge you
desire for your 8-bit until you get bored of it.

Well, collectors might have a different idea I guess. :)

http://www.cc65.org

A cross compiler for C programs (includes an assembler and linker as well.)
Doesn't have an IDE, but you can use your PC tools and then run the
software in an Atari emulator, either for Windows or Linux.

He listed the Action cart in the section for video games, not the
normal location for our favorite antiques. It's a miracle he got bids
on it.

Hi!

Start assembler programming. I could help getting going if you like. I use AMAC and Textpro for this. Works great. Have source codes for my demos and game on my page if you want them. www.games.nmi.no under Atari and Atari 8-bit and then Download section

Good luck in any language you decide on!

Hi all...

So I'm trying to remember the name of this old Atari 8-bit game. Two people could play simultaenously, one as a kangaroo and one as a squirrel. The playboard consisted of tiles that scrolled downward and occasionally sped up. You had to hop from tile to tile, and as you hopped off a tile, the tile would disappear behind you, leading to some frantic jumping hilarity as you tried to trap the other player behind missing tiles.

Anyone remember the name? We used to howl in fits of laughter playing this game.

Thanks...

-Rich

Yes, you are right however i've been hunting an original cart for a long time,
i think i'm a nut collector, you see, Atari was in Mexico for only a brief time,
and the software they deliver was mainly game cartridges an stuff like that,
most of my Atari originals are games, or things that i've got from e-bay, in
fact the only original software non-Atari that i bought here was the
Kyan Pascal package, i still have it complete, and even my Indus Gt have
an Atari Mexico sticker at the bottom. Greetings from Mexico.

The best is probably Action! if you can get it or you can download a disk crack
anywhere on the web just go to xl search and give it a go, you can also use
Quick, it is very nice and the price is right 5 dollars in your mailbox from
Dan G. out there, very nice guy by the way, if you like basic you can get
Turbo for free, or buy a Basic XE or XL from ebay, there's also Kyan Pascal,
and maybe half a dozen assemblers and other assorted programming enviroments.
You can also get info on Atari from http:\\www.atarimagazines.com and even
check a copy of Ian Chadwik's gem Mapping the Atari. Hope it helps. Javier.

3474. OSS Carts

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-09 17:10:04 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041009131004.15280.00001588@mb-m22.aol.com>
Source record: 14378

I am curious about "orange" and "black" OSS/ICD/FTE carts -- which are more valuable? The orange carts + the nice binders originally retailed for $100 (IIRC). The black carts were cost-reduced and had soft-bound manuals, and they retailed for $69 or $79 from ICD and finally FTE sold them for $49 with toolkits. (again, IIRC)

I've had a lot of both orange and black carts, and have found that the black carts fail far more frequently. Actually, I've never had an orange cart failure.

But I still have a gut-feeling that the black carts are more valuable as collectors items. Of course, the language also affects the prices. BXL seems to be the least desirable/expensive and Action! and Mac65 the most desirable with BXE close behind. (?) Any thoughts on this?
Larry

Pasi, this thread is crossposted, and I suspect Carmel is from the Atari
camp. He likely isn't interested in reading a book that would prove his
opinion of Jack Tramiel wrong.

From: Ben Corr <bjcorr@sonic.net>
Message-ID: <oS2ad.16821$54.275870@typhoon.sonic.net>
Source record: 14385

Hey everybody!

I am looking for some assitance from any of our atari friends in Germany. I recently sold some rather expensive atari gear to some one in Germany and they are not paying up. I just want to find out who I can contact in Germany to persuade this gentelman that this is not a nice thing to do....

Thanks!

Ben Corr

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

3483. FS: HDD interfaces for 8-bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-10 04:43:59 UTC
From: Jerzy Dudek <jurek@cnd.pl>
Message-ID: <ckafaf$dg9$1@nemesis.news.tpi.pl>
Source record: 14386

Hi,

I've got for sale brand new HDD interfaces for 8-bit Atari, but only for those equipped with Expansion socket (all 130XE and some 65XE). It is very fast, in my opinion the best interface for connecting IDE hard disk. It is called KMK/JZ IDE. Interface is connected to Cartridge and Expansion port. You may configure it as you need, drive may have up to 16 partitions 16MB. Of course it is possible to use even 80GB HDD, but left space will be wasted. It is possible to boot from any partition. If anybody interested and needs further information, please contact me.

Cheers,
Jurek.

Definitely Flip and Flop. Utterly hilarious. I can get about 4 levels
before it gets too difficult. The way the field inverts for the monkey
is the really hard part, because your eyes (or brain) is used to
seeing it the other way.

the 600xl has the same expansion port on the back as the 800xl so any
device designed for the 800xl will work.. so yes you could upgrade the
600xl to 256k, 1meg and so on as easily as you could upgrade an 800xl.

> Instead of discussing Hitler and his doings, shouldn't be be
> concentrating on how tramiel nearly screwed CBM and ultimately screwed
> Atari... Isn't that what we should be focusing on

Exactly. Mr. Tramiel screwed C64 at first - it was planned to be a
console and not that horrible screwed home computer with stupid Basic
equipped no graphics and sound commands.

Second screwed CBM computer was VIC20, just because the success of it
and Tramiel's one-and-only computer strategy when C64 production
rosed.

Last screwed product was Atari ST. Mr. Tramiel abused Amiga team but
failed to get Amiga for bargain price and therefore Tramiel's team
screwed something very fast from commodite components like M68000 and
old AY chip and named this mess Atari ST.

Or maybe I'm completely wrong. Tramiel just started great CBM company
satisfying milions of people with production of great computers like
VIC20, C64 and Atari ST later on. And the rest is history.

If you want to blame Tramiel just because he becomes not Bill Gates
and is not ruling the world anymore it's your problem. Take into
account he's 70-something now. And you maybe played with his product
for more than decade long.

Stanley

IMHO Nazi Party = NSDAP. There is not any other nazi party /I mean
acceptable 'good' nazi party/. For example German nazis killed many
czechoslovak national socialist party members during occupation in
1940s. So as you see term national socialist could designate
democratic party member. But term nazi definitely not.

As I know all SA and SS members were NSDAP members /nazis/ and
majority of high ranked officers in Wehrmacht were NSDAP members
/nazis too/. Therefore nazi=member of NSDAP or at least strong
supporter of it. In normal democracy nazi=enemy of normal people,
enemy of democracy, enemy of human rights. It's similar to fascist =
supporters of Mussolini and his party/regime.

> socialists) who were not necessarily only Germans, neither were, or
> are, all Germans Nazis!

Of course not. It's just a pity that majority of Germans did not stop
nazis to do such horrible atrocities and damage to other nations
during 1930s and 1940s.

My Basic XL is in an Orange cart. The Chips inside are cased in
ceramic. I think the only cart I have like that.
My Mac/65 is a black cart. Both carts still work.

> and not jack himself (it was them that screwed it up, not jack

IMO: It would not have made a difference. Everyone was crushed by IBM style clones. The only survivors were Apple and HP because of niche markets. Even the clone manufacturers had a shaking out.

The 'game' computer label that kept Atari and CBM out of the business market can't be blamed either. Plenty of business types like Wang, Victor, Olivetti, Digital Research, etcetera went by the way side.

Mistakes made: Things like not being able to expand the ST and losing the engineer who designed it. I mean it wouldn't have made a difference if it wasn't expandable but another 6 month from start to market came out. Thing is STs and Amigas were much more expensive then an equivalent clone after the market matured.

There was just too much fat in the old system because of legal looting of companies via stock options and excessive pay. When you read about some fat cat suit getting $140,000,000 in compensation, that is what I am talking about. That was the rule back then and not the exception. You just can't add 100s of millions of dollars to the overhead of a business firm and not expect to suffer in the market place.

The two large chips in the orange card feel like they are packaged in
ceramic (or something similar.) Taken out of their sockets, they are
surprisingly heavy. Most other Atari carts I've had, the big chips on
the PCB are packaged in something that feels like some sort of
epxy/resin/plastic. I don't take apart all my carts, so I'm not sure
how common or uncommon this is. But the OSS Orage cart for Basic XL
is the only one I've noticed that is like this.

3510. Re: Talking A.I. Eliza-clone for Atari XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-12 18:41:15 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <416C254B.E35274DC@students.uni-mainz.de>
Source record: 14315

Well,
the programs I have are really Atari Basic, they just use one ML program from the SAM disk to talk. Of course the talking version of Eliza has been updated / patched a little bit to work correct with speech... if you wanna see or test it, just e-mail me and I will return that ATR image with (german) talking Eliza to you. Sorry, I merely have the german version, but I would not be too surprised if thats just a clone/patch of the former english version... -andreas.

P.S.: Just a short example for the (german) talking Eliza:

Eliza: Hallo, ich bin Elisa deine Psychotherapeutin. Sprich doch ein wenig mit mir. (in english this would be: Hello, I am Eliza your psychotherapist. Come talk to me.)
Meine Eingabe: Hallo Elisa, wie geht es dir? (My input: Hello Eliza, how are you?)
Eliza: Ich denke wir sprechen hier ueber dich und nicht ueber mich. (Eliza: I think we are talking about you and not about me.)
...

Note: Whenever Eliza says something, the screen blackens and you can hear the speech. Next, the screen is turned on again and you can read what she said. Then you type in a new sentence (or a question or whatever) and wait for her next reaction and so on... The program is quite easy in using (and I guess that almost every Atarian has seen or used Eliza one time; the biggest problem of the talking Eliza -the version I have- is that it uses german language. well, at least it might be a problem for you, since I am used to talk german language...)

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <416C26C3.4EF12886@students.uni-mainz.de>
Source record: 14318

Well,
afaik PC 5,25" drives (both DD and HD) cannot read Atari SD (90k) disks.
So better use an original Atari floppy (like 810, 1050, XF551, Percom,
Indus,...), a good A8 emulator like Atari 800 Win, Ape, etc. and a
SIO2PC cable to convert all your Atari SD disks into ATR images. Alas,
this method still requires A8 hardware - but I think it cannot be done
otherwise... -Andreas.

Rich schrieb:
>

I understand now. Those are Eproms, and the programmable "chip" inside of them is in a ceramic shell, most likely with a little glass "window" for erasing. The glass window should be covered with paper to help keep out light -- UV wavelength, I believe. They probably say something like 2764, maybe with some other numbers added and the mfg's. name. Most "orange" carts were built this way, using two 2764 (8KB) Eproms.
Thanks,
Larry

Hi Andreas-
Was there a commercial German version of Sam? Or did users add German words via the "Reciter" function. I'm curious, because I presume that the "speech" from Reciter would sound very unusual when used for German. (?)
But IIRC, both English and German have a common language root, so maybe not.
And also, SAM sounds pretty "unusual" in English! :-)

> from Reciter would sound very unusual when used for German. (?)

Not at least as far as I'm aware of. The main problem, besides the
lack of a german text to phonem translation, is the lack of quite some
german phonems. Just to give an example, there are two "ch" sounds in
german that are not available in the english language, leave alone the
umlaute. (Vowels with funny dots on top)

So long,
Thomas

Atari was in Mï¿½xico arround 88-2004, they used to sell the computers in
stores like Wallmart, in fact there was a chain called Comercial Mexicana,
that was the only vendor that i was aware of, in fact i purchased almost all
my equipment from auctions and such. I also have a spanish version of
De Re Atari, with some typos here and there and a bunch of old Antic mags.
From Atari Mï¿½xico i bought the Atari assembler cart and Kyan Pascal, i think
they also sold Microsoft Basic and maybe a couple of other stuff, i bougt
Logo from a guy that also sold me a 65XE, an Indus, an Epson compatible printer
and Interface and a cart made in Mï¿½xico, donï¿½t remember the name that the guy
used for word processing.

3521. No colour with Atari XE Game System

Message-ID: <ckmimd$mk0$1@paperboy.Austria.EU.net>
Source record: 14330

Hi,

I recently bought an Atari XE Game System (PAL version) which seems to
work perfectly well; however, the picture is always black-and-white.
I tried the built-in game, the self-test programs and BASIC mode, with
both composite(?) and antenna output. Therefore, I think, it's a
hardware problem.

Does anybody have experience about what could be wrong? If I get a
working Atari 800XL, can I just put its video chips (ANTIC and/or GTIA?)
into the Game System and expect the problem to go away?

Thank's in advance for any hints,
Richard

I'm not sure what you mean by 'converted'. Perhaps converting the ATASCII to ASCII? You have the ATRs of AMIS, so you probably have SAVEd files and need to convert to LISTed files. You would do that by LOADing the BASIC SAVEd file and then LISTing it to an empty disk. Then the only thing you'd need to read with a simple PC text reader would be to convert the ATASII to ASCII.
I've never understood why BASIC programs are stored in ATRs, rather than just the program, or even better as an ARCed or ZIPed file.

3529. Vintage Computer Festival 7.0 - Nov. 6-7 [NERDVANA!!]

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-15 12:52:03 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <TJPbd.395464$Fg5.6437@attbi_s53>
Source record: 14340

Vintage Computer Festival 7.0
Saturday, November 6 through Sunday, November 7
Computer History Museum
Mountain VIiew, California

Since the last VCF, the trials and tribulations of daily life made their inevitability painfully attendant: bills came due, accidents happened, bad days at the office were had, arguments broke out, and the morning paper was thrown into the sprinklers yet again. Woe is us! But lo, a bright and shining beacon of nerdilicious salvation is on the horizon and draws nigh. The Vintage Computer Festival returns!

Vintage Computer Festival 7.0 is right around the corner, taking place on November 6-7 at the Computer History Museum in Mountain View in (still) sunny California. Flights are cheap and so is the admission, so you have little excuse to stay home cramped behind your computer trying in vain to craft that perfect Google search term. Just put all that nonsense behind you and join us for some fanatical Festival folly!

We are honored to once again have the Computer History Museum as our sponsor!

And as always, we bring you yet another wonderful line-up of speakers, exhibitors, and special events, including a 30th anniversary retro-spective of Maze War, the original "first-person shooter" videogame, plus so much more!

In fact, we're planning so much for this year's event, it might possibly be even too much! Some of it we can't even mention yet because we're still in the middle of planning it. So come on out and watch us put on a gargantuan geek gala guaranteed to gasify your gall bladder...either that or watch us crash and burn in spectacular style. Either way, it's sure to be entertaining!

Exhibitors Wanted!!!

One of the best ways to enjoy the VCF is by participating directly. Be an exhibitor! As an exhibitor, you get to be a part of all the behind-the-scenes action. Plus you get a chance to show off your favorite computer and perhaps even win an award for an outstanding exhibit. The Best of Show award includes as a prize the Replica 1, a software compatible re-creation of the legendary Apple-1 computer, courtesy of its creator, Vince Briel. So don't delay, sign up today!

http://www.vintage.org/2004/main/exhibit.php

More information about Vince Briel's Replica 1 can be found on his website:

http://home.comcast.net/~vbriel/

We've Got Lodging!

For out of town guests, the VCF has arranged a hotel room block at the Residence Inn Palto Alto Mountain View, located within 3 miles of the Computer History Museum and featuing, among other fine amenities, an on-demand shuttle service between the Inn and the Computer History Museum. The special VCF rate is US$79 per night. Reservations must be made by October 15 to take advantange of this terrific rate so do not delay! Full details are available here:

http://www.vintage.org/2004/main/lodging.php

Computer History Galore!

The VCF speaker schedule has moved back to a "track" style this year. The talks are assembled into themes for the most part. We've got another terrific line-up! Check it out:

Saturday, November 6

Track 01

Time	Topic	Speaker
10:00am	Using Vintage Computers in Forensics	Fred Cohen
11:00am	Documenting the BBS	Jason Scott
12:00pm	The Art of Textmode	Christian Wirth
1:00pm	History of FidoNet	Tom Jennings

Track 10

Time	Topic	Speaker
11:30am	Confessions of an Entrepreneur	Dr. Robert Suding
12:30pm	VCF Ramblings	Sellam Ismail
1:00pm	Computer History Museum Update	CHM Staff

Sunday, November 7

Track 01

Time	Topic	Speaker
10:00am	Early IBM History	John Sailors
11:00am	The IBM 360 Evolution and Revolution	Jerome Svigals
12:00pm	Early Microprocessor Design	Nick Tredennick
1:00pm	Maze War Retrospective	Panel

Track 10

Time	Topic	Speaker
10:30am	Things You May Not Know...	Evan Koblentz
11:30am	Tipping Sacred Cows	Tom Jennings
12:30am	The Art of Vintage Computers	Christine Finn
1:30pm	Neo-Retro: The XGameStation	Andre LaMothe

More information on the VCF 7.0 speakers can be found here:

http://www.vintage.org/2004/main/speaker.php

BBS Documentary Screening

Jason Scott, proprietor of textfiles.com--the Internet's largest collection of historic textfiles--has completed work on his BBS documentary. "BBS: The Documentary" spans across seven separate films which cover every aspect of the world of bulletin board systems, tracing the history of the BBS as well as the historic figures that made it a distinctly unique mode of digital communication. This will be the first public screening of the documentary, and audience input from VCF attendees will determine the final cut of the film series. More information on the screening can be found here:

http://www.vintage.org/2004/main/screening.php

Computer History Museum Tours

As always, the Computer History Museum's terrific staff will be giving VCF attendees tours of the Museum's fantastic collection. Tours are held in the afternoon and run every half an hour. Tour information is available here:

http://www.vintage.org/2004/main/tours.php

Buy, Sell and Trade at the VCF Marketplace

As always, one of the most exciting aspects of the VCF is the Marketplace, where you can find a large and varied assortment of some of the most fantastical old computer thingies anywhere. Find that odd part you've been seeking out for your collection, then touch, smell, even taste it if you like, before haggling out a deal. There is simply no better place to buy and sell vintage computers than at the VCF Marketplace. Vendor booths are still available. For more information on selling at VCF 7.0, please visit:

http://www.vintage.org/2004/main/vendor.php

The VCF 7.0 BBS is Live!

Communicate with fellow VCF 7.0 attendees on the VCF 7.0 BBS! Set up trades and carpools, talk about exhibiting, and discuss generally anything about the upcoming Festival:

http://www.vintage.org/2004/main/bbs.php

So Much More!

Complete information about VCF 7.0, including the speaker schedule and exhibit roster, as well as lodging information and driving directions, can be found on the VCF 7.0 web pages:

http://www.vintage.org/2004/main/

Keep in mind that the VCF will from now on be held during the first weekend in November.

;)

3530. Re: No colour with Atari XE Game System

I must ask the obvious. Are you connected to a PAL TV ?

The 800XL has 2 crystals. One will be the main system clock. The other is probably the PAL colour burst frequency. Check that are both not physically damaged. I think that you'll find that the ANTIC / GTIA are not socketed in all units.

Regards

Mike

With windows you can select all your zip files, drag them to where you want
to unzip them to, with the right mouse button down. You should then get a
menu that allows you to choose Winzip, Extract to here.

Let it go.

Use a command line unzipper such as the Winzip CL option, or PKUnzip.
Use the DOS "FOR" command to do it. Check your help section on the
use of "FOR".

Try using WinRAR instead. It's much better/easier.

3540. Atari EXE to ATR conv tool for Linux?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-16 07:51:24 UTC
From: bill@newbreedsoftware.com
Message-ID: <0q4cd.17467$54.293816@typhoon.sonic.net>
Source record: 14197

Has anyone got a pointer to a tool that can take an EXE and convert it to
an ATR containing that file?

I'm using AtariSIO on Linux to boot my Atari, but have a number of loose
EXEs that I'd like to drop in (e.g., as an ATR in Drive 2). At the moment,
AtariSIO doesn't have a way of 'mounting' them like APE does.
(Or at least, I remembered it being able to do back when I had an MSDOS 6 PC)

Thx!

I kind of expected that question. :)

Yes, it's a PAL TV and I even tried to switch it to NTSC to find out if
the Atari doesn't actually output an NTSC signal.

You are right: unfortunately none of the chips is socketed. And there is
no visible damage to both crystals. So I guess, there is no easy solution...

Thank you for your response,
Richard

Ah, for that to work under Losedows one probably has to download
something like Cygwin, which is a good "first step into a larger world"
anyway.

Doesn't any of the emulators allow you to mount both an .ATR and a
harddisk directory at the same time? Then you should be able to move the
files between those.

Please check that potentiometer near TV modulator is not damaged. Due to presence of a hole underneath, some people put there a screw and damage the slider of potentiometer. I've seen many such damages. If it is OK, you may try to turn it left or right to get a color picture.

Cheers,
Jurek.

I wouldn't mind it to be SECAM (well not much, anyhow), because my TV is capable of this standard too. However, no matter which standard I select, the picture stays black & white.

It seems to me, that there is no colour carrier at all, because even when I connect it to the luminance input of my Commodore 1901 monitor, there isn't any of the visible distortion normally caused by composite signals.

Hmmm, the only potentiometer I found was in the middle of the board.
According to http://www.atari-explorer.com/xegs.html this is a "Colour
trimmer". Turning it around--and also short-circuiting it--didn't change
anything, however.

How would I know, if the potentiometer was damaged? It doesn't look
damaged.

I measured a resistance of about 500 kiloohms first; after some turning
around this changed to 60 kiloohms. However, it still sits on the board,
so probably these measures are not valid. While the Atari is switched
on, there is always an electric tension of 7 volts between the poles.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

3550. The Diskette Experiments

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-17 10:12:23 UTC

"The Diskette Experiments: A Hypothetical Longevity of the Floppy Disk"
By: Paul Allen Panks (dunric@yahoo.com)

See website for details. Written summary below:

http://members.tripod.com/~panks/diskfun.html

In three separate experiments (conducted at regular intervals), I have determined the hypothetical longevity and general integrity of data (both read and recorded) on the standard 5.25" floppy diskette. Such diskettes are common to the Atari 400/800, Commodore 64/128, Apple II/IIe and other 8-bit computers. 3.5" disks were not tested.

Here are the results of my experiements (conducted on 5.25" floppy diskettes for the Commodore 64/128 line of microcomputers):

****
Experiment One: Freezing diskette (Conducted in January 2003)
****

Hypothesis: Frozen diskettes lose data, even if frozen overnight.

I froze a diskette overnight in a freezer, without the diskette holder protecting the exposed mylar surface. I left the diskette intact inside the disk jacket, though.

The disk received condensation on the exposed portion of the mylar surface (of the diskette), and was extremely cold to the touch. I noticed no physical alterations to the diskette, however (e.g. no warping or physical damages; only coldness and condensation).

The disk drive booted the floppy disk directory without effort, and the contents read without problem. Programs all loaded without error.

Conclusion: Freezing a diskette overnight probably won't damage the diskette enough to ruin diskette data integrity, but probably isn't a good idea, anyway.

****
Experiment Two: Overheating diskette (Conducted in June 2004)
****

Hypothesis: Heating a diskette to even slightly above room temperature is asking for data loss.

I overheated a diskette next to a space heater, without the diskette holder
protecting the exposed mylar surface. The diskette melted a little bit

near the center, at which point I removed the diskette from the space heater's range of heat. The diskette was heated for approximately 10 seconds at a distance of 2-3" (inches) from the space heater.

DISCLAIMER: *Do Not* attempt this experiment *at all* unless you have _already_ safely practiced doing so!!! Heating any object near a space heater is *VERY* dangerous and should *NOT* be attempted by unexperienced person(s)!!

The reason(s) for testing the heat durability of a 5.25" diskette were two-fold: One, I wanted to disprove the notion that a minimal amount of excess heat can ruin a diskette's data integrity. Secondly, I wanted to test the theory proposed that 5.25" HD (96 TPI) diskettes could still be formatted with a 1541/1571 disk drive despite the small Tracks Per Inch (normal is 48 TPI on the Commodore 64/128 computers for a 5.25" diskette).

Conclusion: Heating a 96 TPI (HD) 5.25" diskette (or 48 TPI diskette) to 95-115 degrees fahrenheit does not appear to affect data integrity in any significant fashion, although outright *burning* of the diskette *will* affect data integrity! The 96 TPI diskette, once heated, formatted without error on both the 1541 and 1571 disk drives, but *could not* be reformatted once the diskette cooled to room temperature (approximately 5 minutes time). Additionally, the diskette had to be reheated to a high temperature once again in order to reformat over the previous formatted contents.

****
Experiment Three: Diskette burial for 554 days (March 2003-Oct 2004)
****

Hypothesis: Burying a diskette for over a period of a year, approximately 1.5 feet underground, will expose the diskette to dirt, rain and other unsavory elements, even when contained within a ZipLock(TM) plastic bag.

This experiment took exactly 554 days to complete...1 year, 6 months and 7 days, to be exact. I buried a floppy diskette with (data on both sides) in my parent's backyard at a depth of approximately 18 inches. I made sure that I protected the diskette as reasonably as possible, including placing the diskette inside a paper disk jacket, while also sealing the entire contents inside an enclosed ZipLock plastic bag.

Conclusion: Even when sealed in a Ziplock plastic bag, and despite being buried 18 inches underground, both the weight of the dirt atop the diskette and the elements of water and wind severely warped the diskette into a bowl-shaped wedge (think: bowl of soup wedged).

The poor diskette was unreadable as is; that is, without removing the mylar internal diskette from the disk jacket itself and placing it inside a new disk jacket (scrapped from a throw away blank diskette I had no general use for). I noted the following damage to the internal mylar diskette as I inserted it into the second disk jacket:

A) Physical damage present near the center of the diskette, where Track 18 was likely to reside.
B) Minor physical damage to the outer diskette, but mostly on the left side where it had warped upward. Nearly identical damage was evident on the right side, where the same warping was circularly present.
C) Non-consequential smearing from dirt, visible just above the (writable) track/sector area of the disk's mylar surface (left of the main diskette ring hub).

The disk was inserted into the new diskette jacket and the jacket itself was taped back shut via normal Scotch(TM) brand tape.

Conclusion: Because the diskette contained data on BOTH sides of the diskette, I expected the back side to have less data loss than the front side (due to warping/other damage). I was right. The results of the data loss on the front side were as follows:

The disk directory read, but failed after only 7 programs had been read (at least 40 programs were on the front side of the diskette in late-March of 2003). This suggested serious damage to the middle of the diskette, namely, Track 18. Not a good start.

I began loading the remaining programs one by one. Program 1, of 38 blocks, failed after only 0.5 blocks had been read. Since it was the very first program on the diskette, this suggested it was written very, very close to where the directory itself was written.

Program 2, a 3 block file, loaded 2 blocks out of 3 before it, too, failed.

Program 3, a 7 block file, loaded fine, with 100% accuracy. However, Line 23 of the program (read in Commodore 128 mode) was complete gibberish, with weird commands like "CIRCLENEW TAN &STEPFOR" where normal, regular BASIC statements would be. Line 24 was normal, as was the remainder of the program. This suggested physical damage to the mylar surface of the diskette.

Program 4, a 1 block file, loaded fine, with 100% accuracy, and listed fine as well.

Program 5, a 63 block file, failed after only 1.5 blocks had been read. This was very similar to how the first program faired.

Program 6, a 9 block file, loaded fine, with 100% accuracy, and listed fine as well (with no errors). This surprised me greatly, as a much smaller program did not.

Program 7, a 3 block file, loaded fine, with 100% accuracy, and listed fine as well (with no errors).

I have not yet checked the remainder of the 1st side with Disk Doctor 4.0, and have not read through each and every Track/Sector to see how it looks in a diskette editor. However, Side 1 lost approximately 500 blocks of data (roughly an 85-90% data loss). This was the most

severely warped (bowl) portion of the diskette, and could only be read by the disk drive when I inserted the internal mylar diskette into a new diskette jacket altogether.

The flip side, which was not damaged much at all, only contained minor errors. The programs occupied a maxium of 61 *total* blocks on the flip side of the diskette, leaving 603 blocks free. The directory read without error, although Track 18, Sector 14 was not readable. Because directory data was not on Track 18, Sector 14, data loss on that particular T/S was not evident.

The programs (7 in all, out of 7 total) read as follows:

Program 1, a 3 block file, loaded 2 out of 3 blocks, but failed. Listing the program only displayed most of it, with the last few lines just pure gibberish.

Program 2, a backup of Program 1 (done intentionally), loaded all 3 blocks, and listed and ran fine.

Program 3, a sequential file of 3 blocks in length, was read through the following "quickie" program:

```
5 PRINT"ENTER FILENAME";:INPUT A$
10 OPEN 2,8,2,"0:"+F$+",S,R"
15 GET#2,A$:PRINT A$;:IF ST<>64 THEN GOTO 15
20 CLOSE 2:END
```

The sequential file read most of the way through, but failed to read anymore data halfway through the last 1/6th of the file itself. Checking a backup of the same file (from another diskette), data loss was between 2-3% of the file, with only the last few sentences lost.

Program 4, a BASIC program of 18 blocks in length, loaded 12 of the 18 blocks before failure. Listing the program revealed gibberish about halfway through the program.

Program 5, a BASIC program of 11 blocks in length, wouldn't even load (gave a "?FILE NOT FOUND ERROR"; wouldn't even grace me with a "LOADING PROGRAM..."?READ ERROR" message).

Program 6, a BASIC program of 19 blocks in length, loaded with 100% accuracy and without error. The program LISTed and was RUN without any errors.

Conclusion: Burying a diskette even 18 inches below the ground for a period exceeding 1 calendar year, even when protected in a ZipLock(TM) sealed plastic bag, is generally *not* a good idea. Water (from rain) and other elements warped the physical nature of the diskette, as did the 18 inches of dirt laying atop the diskette (inside a sealed ZipLock(TM) plastic bag). Even rescuing the internal mylar floppy from the disk jacket and transfering it into a fresh disk jacket failed to solve data loss. Physical damages to the diskette, although minimal to the eye, were nevertheless responsible for a total of at least 38

programs (out of 45 total) either loading only 65-70% of the way, failing altogether (0%-2% of the way) or loading without error (only 5 loaded without error, and the largest program of that variety was a mere 9 blocks in length).

Final Conclusion: Diskettes are surprisingly resistant to temperature, but are very fragile to dirt, water and other environmental factors. Even minor physical damages to the diskette surfaces caused substantial diskette errors/loss. Errors noted (on either side) were: #20, #21, #22, #23 and #27; no other diskette errors were noted or found).

Sincerely,

Paul Allen Panks

I certainly remember it, never joined it but received the catalogue. I also believe they sold software too. Just imagine all those hundreds of games are still at around somewhere, provided they haven't been dumped in a skip.

Talking of skips, I remember many years ago somebody finding loads of software dumped in a skip in Doncaster near where I live. There was a company called CDS, probably most famous for Steve Davis Snooker, when they went bankrupt and the offices were cleared out all the unsold stuff went in a skip. Some of it was rescued! Most vanished into landfill!

3552. ATARI 8-BIT SOFTWARE FROM RICHARD GORE

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-17 12:47:20 UTC
From: Richard Gore <richard@rgore.freeserve.co.uk>
Message-ID: <cktpk2$b00$1@news7.svr.pol.co.uk>
Source record: 14209

Dear all 8-bit users
After many years of absence I finally found
my way back onto these pages. I don't know if anybody remembers me but I did
some commercial software retailing and a bit of programming some years back.
I've dusted down and opened the boxes, here's what I have left;

GAUNTLET DEEPER DUNGEONS DISK US/MINDSCAPE Version £5 - $10
SUPER PRINT LAB XE DISK (my own creation, graphics 8 design and print
program) £5 - $10
SOLAR STAR DISK (commercial game from Microdaft) £3 - $5
ARENA* (commercial software from Visionaire software) £5 - $10
BUBBLEZONE* (commercial software from Visionaire software) £5 - $10
MOUSEKATTACK £5 - $10
JAWBREAKER £5 - $10
GTRACKER and XL utilities disk (digi sound manipulation) £5 - $10

* also available as PC XFORMER and XL-it! games on PC disk, same price.

If anybody is interested, prices include p&p / shipping by cheapest
method.

No, they didn't sell software although they may possibly have occasionally
sold old titles that weren't generating rental income. They certainly bought
titles - usually for rental credits. The rental library had a great stock of
games on cassette, cart and disk and it was a fantastic way of playing games
that would otherwise have been too expensive to buy (Atari disk game prices
in the UK were certainly silly). They were based in Cheltenham iirc and I'm
certain I do.

I played about £25 for Steve Davis Snooker cassette for the Atari 800. It
was an absolutely shit game and a clear rip off - an early example of
cashing in via a licensed name. The ball physics - if that's the right
word - were non existent. It was more like a game a bad game of marbles.

Gareth.

> (Or at least, I remembered it being able to do back when I had an MSDOS 6 PC)

Actually, that's one of the new parts I'm currently working on (the
other one is Printer support) :-)

So far, these new parts already work quite fine but maybe need a little
bit more testing. The "virtual drive" functionality, as I called it,
supports (MyDOS-) subdirectories, an integrated gamedos, and writing
of files and creation of directories on the PC.

Anyone who is interested in beta-testing, just drop me a line and I'll
email you the latest snapshot.

BTW: another solution to convert files into ATRs is 'unix2atr'. Just
ask google about it.

so long,

Hias

Try unix2atr from http://www.crowcastle.net/preston/atari .
It doesn't take a single EXE, but all files from a subdirectory and
makes an ATR out of them.

Howdy folks

For this Atari project I am working on (come to the JHV of the ABBUC next saturday october 23th and I will show you) I need to copy several PC directories into a textfile. Like what happens if you type A in DOS and then give "Dx:Filename.ext" as the destination. Please help. I wanna do this from Windows XP or the DOS-prompt if possible.

CU Mathy van Nisselroy

PS please cc to mathy@mathyvannisselroy.nl

At the command prompt (it isn't DOS anymore), go to the directory you
want listed and type the following:

dir > filename.txt

If you want to do subdirectories do a

dir /s > filename.txt

Mathy,
As shown above but you can use:
DIR /B /D /L /N /O:G > TEXTFILE.TXT
and get long filenames sorted with no summary of file attributes and sizes.
Or at the Command Prompt type: HELP DIR to get all parameters for the DIR
command..

Good Luck

I did a quick port of my old Dos app that converts EXE's to self booting
atrs.
I compiled it with:
cc makeatr.c atr.c
and converted one EXE to an ATR, and booted it into an emulator but that is
the extent of my testing.

3569. Where can I buy 8-bit IDE/CF adapters?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-19 13:40:33 UTC
From: wandererstill@yahoo.com
Message-ID: <ab3a1ee1.0410190540.4bf6554d@posting.google.com>
Source record: 14226

Hi. I've been poking around the net looking for IDE adapters for the 800XL or the XE Game System I can buy, but they all seem to be sold out or in the plans stage only. Alas, building one of my own isn't an option, because if I pick up a solder gun, I *will* send myself to the hospital and possibly set my house on fire.

I saw Jerzy Dudek's interface on eBay, but it doesn't do it for me -- I want something where I can mount the interface either in a cartridge or inside the computer's case itself, and I'm scared by the fact that his interface only seems to work with an unpredictable, small number of XE systems (if I read his eBay post correctly.)

I looked at the faqs and found plenty of plans, but nowhere to buy interfaces. Can anyone point me in the right direction?

Also, does anyone have an interface where I could use a 256 MB CF card as the mass storage rather than a hard drive?

Oh, excuse the weird name up above. I screwed up entering my info into Google.

Thanks.

Hello Larry,
afaik there was no official german version of SAM, so I guess they
really used the mentioned "Reciter" function... It is really hard to
understand Eliza when she is talking (besides, her voice sounds male not
female), so it is quite good that one can read what she said
afterwards... last not least, in the german version Eliza does a lot of
"grammar" mistakes (looks like the program has been converted fast from
the english version without taking care about german grammar)... anyway,
it is still funny to let the Atari talk... -Andreas.

3572. Re: How do I copy a PC Directory into a textfile?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-19 17:11:13 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41754AB1.965C48E8@students.uni-mainz.de>
Source record: 14229

Well,
for many years I had the same problem - and a friend told me that this is not possible under MS DOS (which I am using on my PC). so I did it at his PC which was (and still is) running under Linux. (T)His OS was even so nice to save the file size (in Bytes) and the Dir/Subdir size in the text, right beside the files and Dirs/subdirs... Thats how I created an info-text (a kind of overview) about the content of my (old) Atari XL/XE CD-ROM...

I know there is a similar program by Bo and Ernest Schreurs, but it not only lists the content of the harddisk (dir/subdir/ATR-images), it also lists the content of every ATR image, so if you happen to have let`s say 100 ATRs with DOS on them you will get a text that shows DOS.SYS (and probably even DUP.SYS) 100 times (plus all the other program-files on these ATR images). So this program creates enormous big text files (see the Pooldisk Too CD, which contains a 16 Megabyte ASCII-Text file, that shows the contents of the complete Pooldisk Too CD-ROMs).

With the Linux Dir to Text function, I listed approx. 5000 images to an ASCII text that ended up in a length of just 80 kbytes (and later I added personal descriptions, so the text grew to 300 kbytes). At the moment I am working on an update of my old Atari XL/XE CD-ROM. Alas, the new version will not be finished to the ABBUC JHV this year. So far, I have filled 2 CD-ROMS (700 megabytes each) with more than 8000 PD ATR-Images and a third CD-ROM with other stuff (books, texts, emulators, utilities and such). My friend is currently converting lots of AVI and MOV Atari videos (mostly adverts) into MPG and MPEG-2 format, I guess that when he is finished he requires 3 CD-ROMS or more for this. So, in the end we have 6 CD-ROMS and I am thinking about burning 1 DVD instead. Besides I am working on another project, recording and converting hundreds of A8 sounds to CD (and then converting them to MP3 format). when finished this will use up another 4-6 CDs (in MP3 format), so maybe at ABBUC JHV 2005 we will bring a Dual-Layer DVD (8.5 gigabytes of data!) with us... let`s wait and see... -Andreas.

You may build-in my interface inside computer, even this not equipped with
Expansion socket (800XL f.e.). You need my interface w/o enclosure in this
case. You may connect CF card to it, you need special adapter IDE->CF to do
this. It will work! If you have ability to solder it inside computer - it
is no problem.

Cheers,
Jerzy

Hi,

I'm in the process of having a MyIDE built for me, but
more pressing work is stopping us from completing this
at the moment. The board is built and the cable's ready
for soldering into my 800XL and a 2.5" HD is waiting to
be housed inside. If this works OK then we may be able
to do a small run of boards (if that's OK with Mr-Atari).

I post details when we get there.

Regards,
Mark

PS Sadly I missed 40 74LS245's on Ebay that went for 99 pence!

It hasn't been demonstrated that it was either. (the story seems to take some severe liberties as it is). Don't get into too many debates, your logic is as fanciful as the story.

>I know plenty of people that think the amiga is junk, so we are even there.

When you get into the hardware and OS routines, its not a matter of what
people think. The ST showed that it was developed in 6 months time.

>Atari OS is open source now, the gui has been worked on etc... this stuff
>evolves you know. In fact it has done some stuff that the amiga didn't do
>for quite some time, like standardized memory protection, etc..

And the Amiga did things out of the box that an ST will never do. Big deal.

>And how many times has amiga changed hands, when will it take the world by
>storm, I don't see it my local pc shop. hehe

And how many times has Atari? You won't see any STs in a computer shop either.

I don't see how losing the engineer of the ST could be a mistake. It was
thrown together in 6 months so they could have something to put on the market
while they kept chichen-lips (C=) in court over the Amiga.

C= made the 6502, Apple used it. MOS made the 6502, which C= bought. C= wanted
Radio Shack to make a computer for them. RS turned them down, thought it was a
good idea and made the Model I.

Mark, I'd positively love to hear if you start producing MyIDEs. MyIDE sounded like the best solution for my project, so I was just crushed when I saw that Mr. Atari had stopped building them.

Can anyone tell me how to create a bootable MYDOS disk given a .ARC
file. I can't extract the ARC file unless I have a bootable DOS disk.
The Linux utilities seem to think the .ARC file is corrupt.

Better yet can someone send me a MYDOS 4.53 image?

Thanks,
Mike

3594. Help identifying this old 1200xl game

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-20 20:03:33 UTC
From: Robert <bob@aols.net>
Message-ID: <drgdn0doe268g5t3jccf0pemrj4kekg853@4ax.com>
Source record: 14251

I used to have a 1200xl with a ton of different games on floppy. I'm trying to recall the name of a game I had. I hope someone can help given this description:

The game took place in 3 or 4 connected rooms of a train station. You were this agent (had an old detectives hat on and just legs sticking out, I think) that had to keep this virus from spreading across the nation that turned people into these little boxes of what looked like static. You laid out these diamond looking-things that would turn them back into normal if they touched them. I remember how you could read train schedules, ride the trains, and look at a screen to see where the virus was spreading. The only thing I can come up with for a name was "Agent" something.

I'm really dying to find out the name of this game. Then I can see if there's a ROM out there or a PC version of it somewhere.

Thanks

I, too, unfortunately missed the MyIDE boat (due to work, moving, not having
cash to spare for one, etc.)

I'm definitely interested in one! And if anyone in the bay area has a
unit they'd like to lend me for the Vintage Computer Festival, that'd be
awesome! :^)

I don't know how you can call the ST "fascinating." I've run across programmers who were horrified on how it ran. Including a Motorola engineer that used to hang out in the FIDO boards about a 100 years ago.

In 1990, I tried writing a GfA BASIC program on "galaxies in collision" based on the algorithm publlished in an Astronomy magazine. I wanted it to work regardless of what resolution you booted up in. If you booted in color, I wanted to change resolutions. You don't change resolutions on the ST very easily.

I could rant and rave about how the ST used two monitors for three resolutions, but what's the point. Could you pull the 68000 and put a 68010 in? Could you add an '020/881 '030/882 upgrade to it? Go past 4 meg RAM? Yeah, the ST sure was amazing.

I hear people wax nostalgic about NeXTStep, CoCo 3s with OS/9, but never an ST. The only thing I miss about the ST is GfA BASIC and Interlink.

My ST2 has a Fast Technologies 16 Mhz accelerator and the JRI color upgrade.

Check your e-mail. BTW - for anybody else wondeing, I believe the files were named "pit11.ATR and pit2.ATR". Both are 180KB disk images. The demo is named Pacem In Terris, and is a Quasimodo production from 2001-2002.

Hello richard... long time no speak (or see), we bumped into eachother
at one of the very last stafford AMS shows (1994 or 1995) I was on a
stall helping out LACE (Peter Mattock and Roger Lacey, roy was the as
well) and I remember you bought either an atari 810 or 1050, i
accidently left the disk in there

Did'nt you do jawbreaker or something... and also Yorkie the 256k u/g
for the xl system

I am looking for a floppy drive for my Atari XEGS.

I would like to find one that matched the "style" of the XEGS but any model that worked would be fine.

So, if you have any model numbers so I can look on eBay or maybe a place that still sells them, please let me know.

email: cbmeeks AT gmail DOT com

That was the one! Sadly, I can't figure out how to get it to play
properly under Atari800 (the characters turn into garbage; must be
an extended RAM bank issue).

I also need to find out where the HECK I put my PAL ANTIC chip for
my real 800XL! YIPES!

Hello, folks, I recently bought a used Atari 400, and when it arrived it was in pretty sorry-looking shape. I got it primarily to play the game I had as a kid, but I cannot get the thing to work. The power light comes on, but I get no picture. I opened the case, but it looked to me like there were no desoldered connections, and the cables looked secure. Anyone have any suggestions on what to look at first to get it running? There were no manuals with the system I bought. I have seen a few sites with field service manuals for sale, but the price is more than I paid for the 400, so I am a bit loathe to go that route yet. Any help would be appreciated.

Well, firstly, you aren't trying to hook it up to the "video" jack on your
TV are you? You will need an RF switchbox hooked up to your cable
connection (coaxial) to use the 400. It doesn't supply composite video,
only a RF signal.

???

> well... but I still need XC12....right ? .. but I don't have it.... <

Check at www.myatari.com. (B&C Computervisions) They have been selling new XC12's on eBay. But if your tapes are Turbo format, then you have the modification issue, also.

If you want a cassette, then you want a cassette -- but have you looked for images of your tapes (ATR or CAS)?

3 Models to be aware of: the 810 SS,SD, the 1050 SS,SD,ED(1050)
Density and the
XF551 DS,DD, this would match your XEGS, other drives that pup up on
ebay from
time to time are: Indus GT SS,DD,ED great looking black case, RANA,
TRACK, PERCOM... My recomendation go for the XF551,this drive does not
writes side b
of a floppy even if it is notched but you can trade disks with a PC
using Util
and a 5.25 drive. If you don't care about trading with pc go for a
1050 with
Happy or buy the plain 1050 and get the Happy latter.

Nope, I am using the switchbox that came with it. It actually looks
to be in good shape, compared to the unit itself. Anything else to
check?

3631. A8 Emulator for Palm?

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-24 06:58:59 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041024025859.12548.00001953@mb-m21.aol.com>
Source record: 14288

I recently received a Zire 72. Is there an A8 emulator for it? I remember hearing about the Pocket PC and a few others, but have not found a Palm OS version. Has anyone run across one?
Thanks,
Larry

Hi all,

I am new to the atari range, i have just got a 130xe but o psu, i found the FAQ and will make a psu tomorow but what carts work and is there anywere is could get a fdd or are there any DIY interfaces out there, what type of cassette deck can i use.

Sorry to be so stupid but as i said i have never used an atari 8but(except the 2600) before

Thanks in advance.

Regards

Graham

Found it! Unfortunately, after about a minute, the graphics get messed
up for me.

Anyone know the 'Setup' values for this demo for a 256KB RAMBO upgraded
800XL? ;^)

Thx!

The Atari 1050 and XF551 drives are good choices for the Atari 8-bit,
but I'm sure others will suggest some cooler drives with niftier features. ;)

If you have a PC running Windows or Linux, you should look into an SIO2PC
cable, like one of these:

http://www.sio2pc.com/
http://www.atarimax.com/order/cableview.html (http://www.atarimax.com/)

And then use software like this:

http://www.atarimax.com/ape/screenshots.html (http://www.atarimax.com/)
http://www.horus.com/~hias/atari/ (for Linux)
http://www.tcainternet.com/wa5bdu/sio2pc.htm

Then you can boot your Atari right off of your PC. (And do things like
print to your PC's printer from the Atari, too.)

> Sorry to be so stupid but as i said i have never used an atari 8but(except

I got a little closer. Back2Life2 (which doesn't seem to run at all :^( )
had an 'auto-detect' feature for banked memory. It gave me:

0: 82 86 8A 8E
4: C2 C6 CA CE
8: E2 E6 EA EE
C: FE FF FF FF

Unfortunately, PIT's bank selection interface only had odd-numbered
values (e.g., "81" or "83", not "82"). I entered as close as I could.
It actually wanted 15 hex values, not 16, so I put in:

83 87 8B 8F C3
C7 CB CF E3 E7
EB EF FF FF FF

It played up until the boss came on the screen, but about 10 seconds later
it turned to garbage again.

I think I'll see if I can reach anyone from Quasimodos, too. ;)

The power supply is 5VDC using a DIN Connector. Find one on Ebay for
about $10 + shipping. I had one that had blown and lopped off the
connector and connected it to a PC power supply. Usually the 130xe
atari power supplies were potted in epoxy, making them impossible to
repair.

An APE cable, APE software and an old PC is probably the most cost
effective way to a hard drive, modem and printer for the atari 8 bit.
I used a pentium 166 and that is more than ample. APE is available in
DOS or Windows.

Also a disk drive is essential. There are several to choose from like
Atari 810,1050, XF551, Indus, Percom,etc. You should get a double
density drive so that you can use any disks that someone might hand
you. Please read the 8 bit FAQ to get an idea of what you may need.

Okay, this is just hilarious... Now, we've all (hopefully) witnessed the amazing Numen demo by Taquart.

Well, they seem to have put together a real-life video based on it (think donut for the real-time torus part... think some parking garage for parts of the 3D animation).

It's frickin' hilarious! :^) The AVI is a whopping 192MB, and is called "Niespodziewanka.avi", over at:

http://ftp.atari.art.pl/stuff/parties/QuaST-Orneta2003,Poland/vhs/

(Woo! I just go to the end credits (where they have some good outtakes of them setting stuff up), and saw myself in the Greetz! Sweet! ;^))

Hmm - when I ran it (just before sending it to you) I had a 50Hz
machine running 576K. I don't know if it needs that much memory - I
doubt it, but it ran fine with those settings.

The bank settings that came up default are

83 87 8B 8F A3
A7 AB AF C3 C7
CB CF E3 E7 EB

It played all the way through, and gave the credits and a short info.

I get nothing really. The screen simply goes blank, no sound, no
lines, nothing really. If I mess with the cables I get some static.
I have tried it with several different cartridges, with no cartridge,
case open, case closed. Heh, I actually got less static when I had
the entire case opened and all the wires hooked up. I tried using an
extra cable I have from an old 2600 for the video/audio output, no go
there, either.

Yeah, I know it works in 256K, because I've seen it before! ;^)
I just am not sure what I did (if anything!) to get it to play /correctly/ ;^)

If anything, I can play the first 75%-80% of it, which should STILL
get oohs and ahhs at VCF.

Hey Graham - I had a red screen on my first XE when I first received it.
Only issue was the color pot needed to be adjusted to bring it back to
blue. Apparently, they're easily "offed" during shipping. Look at the
bottom of the machine, and you should see the correct hole to put your
small flathead through to adjust the pot. Sounds kinda kinky, eh? :)

8-Bit Classics is an online commerce store specializing in the classics video game and console systems. In the past few weeks, we have added some cool features.

The store now can now be searched on Froogle (froogle.google.com). Here is a direct link:

http://froogle.google.com/froogle?q=store%3A8bitclassics

Or you can do a general search on products in Froogle and if it there is a match, our Inventory will show up.

We have updated the style of the store to a little more high tech look. We have also added features like a Poll Booth, Currency changer(non US Dollar), checkout without being a member, and forums.

Current poll asks, "What is your favorite 8-Bit computer system?", vote now for your favorite. Past poll was "Are you planning on purchasing the Atari Flashback?", 75% no, 25% yes.

Don't forget to use NEW20 when checking out to save 20% off your first order.

The ATARI 8 Bit is EVIL, it's the work of the devil, made to collect your
souls and to turn you into brainless slaves of hell.

If you like the ATARI 8 Bit, you will lose your soul to be damned
for eternal torment in hell.Demons and devils will feast on your soul
for all eternity.

So stop using this evil system now to save your soul.

Or the holy inquisition will come for you and burn your flesh to save
your soul, because the devil must not collect more souls or nobody can
prevent Armageddon.

The ATARI 8 Bit is evil, using an ATARI 8 Bit is BLASPHEMY , only heretics and
witches like the ATARI 8 Bit.And heretics and witches shall BURN !

ATARI 8 Bit = hellish computer manufactured in Hell's Kitchen by Satan !

Well, it was a waste of bits of course... except for the fact that
it gave me the best laff i've had all day.... well not really.. but it
was pretty good... definately worth ONE read.... but then again,
I shall probably regret seeing it by tomorrow... So I shall not
continue writing this post, and regret that as well... oops, now I
am starting to waste bits as well... hmmm how do I fix this... I think
I will just keep writing until I run out of things to ramble on about.
No... That doesn't seem to work either... Boy, are you lucky
I deleted the scads of crap i just wrote! whewwyy!

Anyway, You are more than welcome to skip this post, but
please don't PLONK me, as my idiot posts are very few
and far between...

Have a Good Day!!

obtw, check this site out if you are a thinking person....

Hmmm,
maybe it was the International Karate Plus (IKP or IK+) demo by some
polish coders - alas it is only a demo, the game itself was never
finished (as always). There is also an older demo version called
"Falcon" by Hurek (Poland of course, to see the main part, press SPACE)
that has the IK+ background... -andreas.

P.S.: If interested in a copy of these demos, send me an e-mail...

Message-ID: <417E7623.5DDBAFDE@students.uni-mainz.de>
Source record: 14168

Well,
on my real Atari XL this happened due to timing/refresh problems with my Compyhop (or better: Megaram 2) RAM upgrade. When I fixed this bug, the demo worked fine. Now I am wondering - it happens on the emulator (I hope that the emulator doesn`t have that bug)...?!? -andreas.

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <417E7718.F6AF9432@students.uni-mainz.de>
Source record: 14169

Well,
the demo requires 15 rambanks. for a Rambo 256k try the following banks:
83,87,8b,8f,a3,a7,ab,af,c3,c7,cb,cf,e3,e7,eb,ef
and if you happen to have a Compyshop or Megaram type RD, try:
23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef

Since the 256k RAM upgrades have 16 banks, you have one bank more than
needed... -Andreas.

Message-ID: <417E78EA.1FE83DCE@students.uni-mainz.de>
Source record: 14170

Well,
there is a little difference of the rambank values, depending on the
status of the OS and Atari Basic. Afaik, the numbers are 3,7,b,f if
Basic is off and OS is on, the numbers are 2,6,a,e if Basic and the OS
are off. So for B2L2 (BAS=off, OS=off) try
82,86,8a,8e,a2,a6,aa,ae,c2,c6,ca,ce and for PIT (BAS=off, OS=on) try
83,87,8b,8f,a3,a7,ab,af,c3,c7,cb,cf,e3,e7,eb,ef this should work...

Of course there are two more possibilities: Basic on + OS on, Basic on +
OS off which should give different rambank values again... -Andreas.

Yep,
this video is available on the ABBUC Jahresgabe 2003 - a DVD with some
nice Atari videos. Afaik some scenes (e.g. the parking garage scene)
were filmed at a "Media Markt" (big *german* computer,video, hifi,...
store) in Poland... It is a great + crazy video worth seeing...
-Andreas.

Again,
on my XL it showed garbage because of the timing/refresh bug. But I
doubt that the emulator has this bug - try the given Rambo values and if
this does not work, use the Compyshop setting and the equivilent CS
values... -Andreas.

3666. ABBUC software contest 2004 results...

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-26 16:39:00 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <417E7DA4.82995D46@students.uni-mainz.de>
Source record: 14173

Hello folks,
the ABBUC JHV in Herten/Germany is over now and so is the software contest of ABBUC. Afaik 13 programs from various programmers took part in this contest and since there were only 7 prices (money!) it was a real contest. So here are the results of the first 7 places and the money they won:

7th place: Jelly Beans by Chris Martin won 50 Euro;

6th place: Atari Greed by Winfried Piegsda and Carsten Strotmann won 75 Euro;

5th place: RMT-Player XL/XE by Raster/Radek Sterba won 150 Euro;

4th place: Atari Hardwaretester by Florian Dingler won 200 Euro;

3rd place: MyPicoDOS by HIAS/Mathias Reichl won 275 euro

2nd place: BOSS-X by Mirko Sobe won 350 Euro

and last not least the 1st place - guess who???

1st place: Dynablaster by Tomasz Biele/MadTeam won 750 Euro

Please don`t make me responsible for the results, I merely wanted to present them here. This year ABBUC payed off all the money for the contest (the winners will get the money soon). And last not least: There will be a new ABBUC software contest 2005 !! So, you have the chance to program a) a game or b) an application/tool/utility that runs on 64k or 128k Atari XL/XE computers and win some money. The rules for the new software contest are available at www.abbuc.de in german and english language (and soon also in polish language). Since there is time until October 2005 - happy coding and my congrats to the winners of this year! -andreas.

Did they do the demo entirely before doing the video? I guess a better
question is: were parts of the demo based on some real-life stuff/locations?
:)

Subject: 0.1) Table of contents

0.1) Table of contents

The Computers
1.1) What is an Atari 8-bit computer?
1.2) What is the Atari 400?
1.3) What is the Atari 800?
1.4) What is the Atari 1200XL?
1.5) What is the Atari 600XL?
1.6) What is the Atari 800XL?
1.7) What is the Atari 65XE?
1.8) What is the Atari 130XE?
1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?
1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?
1.14) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What video display devices can I use with my Atari?

Mass Storage
3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?
3.2) What other cassette recorders can I use with my Atari?
3.3) How do I run a program from cassette?
3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?
3.5) What other floppy disk drives can I use with my Atari?
3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.7) What can I do to extend the life of my floppy disks?
3.8) How can I use a hard drive with my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?
4.4) What other printers can I use with my Atari?

MODEMs
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What other modems can I use with my Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?
6.6) What graphic tablets were produced for the Atari?
6.7) What lightpens were produced for the Atari?
6.8) What lightguns were produced for the Atari?
6.9) What paddles were produced for the Atari?
6.10) What voice/sound synthesis hardware was produced for the Atari?
6.11) What sound-digitizers/samplers were produced for the Atari?
6.12) What sound-enhancement upgrades were produced for the Atari?
6.13) What MIDI enhancements are there for the Atari?
6.14) What graphics enhancements are there for the Atari?
6.15) What types of memory upgrades are there for the Atari?
6.16) What networking hardware is there for the Atari?
6.17) Can I attach an ISA card to the Atari?
6.18) What preventative maintenance can I do on my Atari system?

Core software: OS, BASIC, DOS, Modem handlers
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What is the ATASCII character set?
7.3) What is Atari BASIC?
7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?
7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?
7.6) How do I modify Atari DOS to support more than two drives?
7.7) Are there Graphical User Interfaces (GUIs) for the Atari?
7.8) What should I know about modem device handlers?

Software
8.1) What programming languages are available for the Atari?
8.2) What cartridges were released for the Right Slot of the 800?

8.3) What games support 4 or more simultaneous players?
8.4) What programs run only on the 400 and 800 models, and why?
8.5) What programs make use of the Light Gun or a light pen?
8.6) What programs have a track ball mode or support a mouse?
8.7) What programs have a paddle(s) or Koala Pad mode?
8.8) What programs have a CX85 Numerical Keypad mode?
8.9) What programs have a Touch tablet mode?
8.10) What kinds of RAMdisks can be set up on the Atari?
8.11) What programs support a RAMdisk?
8.12) What programs require a RAMdisk?
8.13) What voice/sound synthesis software is there for the Atari?
8.14) What programs support stereo and upgraded sound?
8.15) What games support online action via modem?
8.16) What programs support Atari computer networking?

Working with Atari files: Compression, File formats, Copying
9.1) How can I work with .arc files on my 8-bit Atari?
9.2) What file formats for entire disks/tapes/cartridges are there?
9.3) How can I copy my copy-protected Atari software?

Interoperating with "modern" computers
10.1) What programs can log in to other computers via modem?
10.2) What programs can I use to host a BBS on the Atari?
10.3) How can I read/write Atari disks on an MS-DOS PC?
10.4) How can I read/write MS-DOS PC disks on my Atari?
10.5) How do I transfer files using a null modem cable?
10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?
10.7) How can my Atari use my PC's HD, printer and modem using APE?
10.8) How can I connect my 1050 drive to my PC with the APE ProSystem?
10.9) What about interoperating with the Apple Macintosh?
10.10) Are there 8-bit Atari tools for the Commodore Amiga?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace most directly with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer, among others. Of these, the 8-bit Atari is most similar to the Commodore 64.

In marketing their computers to the public, Atari always had to contend with their company history and reputation as a maker of video games. While the 8-bit Atari computers in their heyday were technically quite comparable if not superior in the worlds of home and business personal computing, they also live up to the name "Atari" with a huge library of video games which were often outstanding for their time.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)

CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
non-NTSC machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++ Char	40 x 24	5
5	13	++ Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14	++ Map	160 x 192	2
D	7	Map	160 x 96	4
E	15	++ Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9	+ Map	80 x 192	1 **
F	10	+ Map	80 x 192	9
F	11	+ Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances

*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse
video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four
2-bit wide, 120 or 240 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to OR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two.
The only 8-bit Atari with a membrane keyboard rather than a full-stroke
keyboard. One of the few 8-bit Ataris lacking a composite monitor port.
Originally released with just 8K RAM, but most were sold with 16K RAM. Atari
sold the Atari 400 48K RAM Expansion Kit, which required a little soldering,
to dealers only.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer."

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Jason Harmon writes: (12 Feb 2004)
"..the early ones had plastic cases on the ROM and RAM modules, and had two thumb tabs to remove the cover to access the modules. Later model 800s had 48K standard, and to improve cooling Atari installed them without the cases but put a small plastic strip across the tops of the cards to hold them in position. These machines also lost the thumb tabs and have regular screws to secure the cover over the memory slots."

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its

popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

There is no PAL (European) version of the 1200XL.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Rarely, some late-model 600XLs were sold with 64K RAM. These may have only appeared in Canada. The box had a round gold foil sticker reading: "64k Memory -- Now with a full 64k of memory built-in."

Normally boots with Atari BASIC (Revision B) enabled; Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port; The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Rev. B, or late models with Rev. C) enabled; Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal (exeception next paragraph).

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (the XE design) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's include the ECI port, but no North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE, including the ECI port. The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

Keyboard connected/no cartridge:
boots to Atari BASIC
Keyboard connected/no cartridge/[Select] held down at startup:
boots to Missile Command
No keyboard connected/no cartridge:
boots to Missile Command
No keyboard connected/no cartridge/[Select] held down at startup:
boots from disk drive
No keyboard connected/no cartridge/[Select]+[Start] held down at startup:
boots from tape drive

[Option] held down at startup = BASIC on
[Option] not pressed at startup = BASIC off
(opposite from all other XL/XE machines)

Andreas Magenheimer writes:
Tip: The confused XEGS Atarian should use the XEGS manager by Mat*Rat (Mathew Ratcliff). This assumes one knows at least how to boot a disk with the XEGS...

James Bradford offers:
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text is taken from De Re Atari (Atari#APX-90008), a book published by Atari through the Atari Program Exchange (APX) and copyright 1982 by Chris Crawford, et al. See http://www.atariarchives.org/dere/ where the full text of De Re Atari is now available online.

The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA. However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the original 6502A microprocessor), all of the XL/XE models contain Atari's customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow them to coexist, ANTIC must shut off the 6502, a process called DMA. The 6502B supports DMA, but in Atari's implementation, it required 4 chips. The 6502C has an extra line called HALT. It is controlled by ANTIC which uses it whenever it needs the data/address bus. The HALT line is on pin 35 of the Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====
ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

Frank Schuster writes (6/1/02):
the patent for the ANTIC processor:

U.S. Patent 4,296,476 October 20, 1981 for a "Data processing system with programmable graphics generator". Inventors listed: Steven T. Mayer; Jay G. Miner; Douglas G. Neubauer; Joseph C. Decuir

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a

SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

Frank Schuster writes (6/1/02):
..here a summary of Atari patents covering technical parts of the GTIA / CTIA or at least the steps of development to it. I found them by following the references made in the "newest" patent 4,324,401 which at the end stands for the GTIA.

U.S. Patent 4,324,401 April 13, 1982 for a "Method and system for generating moving objects on a video display screen". Inventors listed: David R. Stubben, Lyle V. Rains. References: 4,116,444; 4,107,665

U.S. Patent 4,189,728 February 19, 1980 for an "Apparatus for generating a plurality of moving objects on a video display screen utilizing associative memory". Inventor listed: David R. Stubben. References: 4,116,444; 4,045,789

U.S. Patent 4,116,444 September 26, 1978 for a "Method for generating a plurality of moving objects on a video display screen". Inventors listed: Steven T. Mayer; Ronald E. Milner. References: 4,016,362; 3,793,483

U.S. Patent 4,107,665 August 15, 1978 for an "Apparatus for continuous variation of object size on a raster type video screen". Inventors listed: Steven T. Mayer; Ronald E. Milner

U.S. Patent 4,045,789 August 30, 1977 for a "Animated video image display system and method". Inventor listed: Stephen D. Bristow. References: 3,793,483

U.S. Patent 4,016,362 April 5, 1977 for a "Multiple image positioning control system and method". Inventors listed: Stephen D. Bristow; Steven T. Mayer. References: 3,793,483

U.S. Patent 3,793,483 February 19, 1974 for a "Video Image Control System for Amusement Device". Inventor listed: Nolan K. Bushnell

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips.

The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The USPTO granted U.S. Patent 4,314,236 to Atari on February 2, 1982 for an "Apparatus for producing a plurality of audio sound effects" - POKEY. Inventors listed: Steven T. Mayer, Ronald E. Milner

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://archives.atarimuseum.com/archives/archives-techdocs.htm
Keith Howell has converted the hi-res TIFFs into clean HTML:

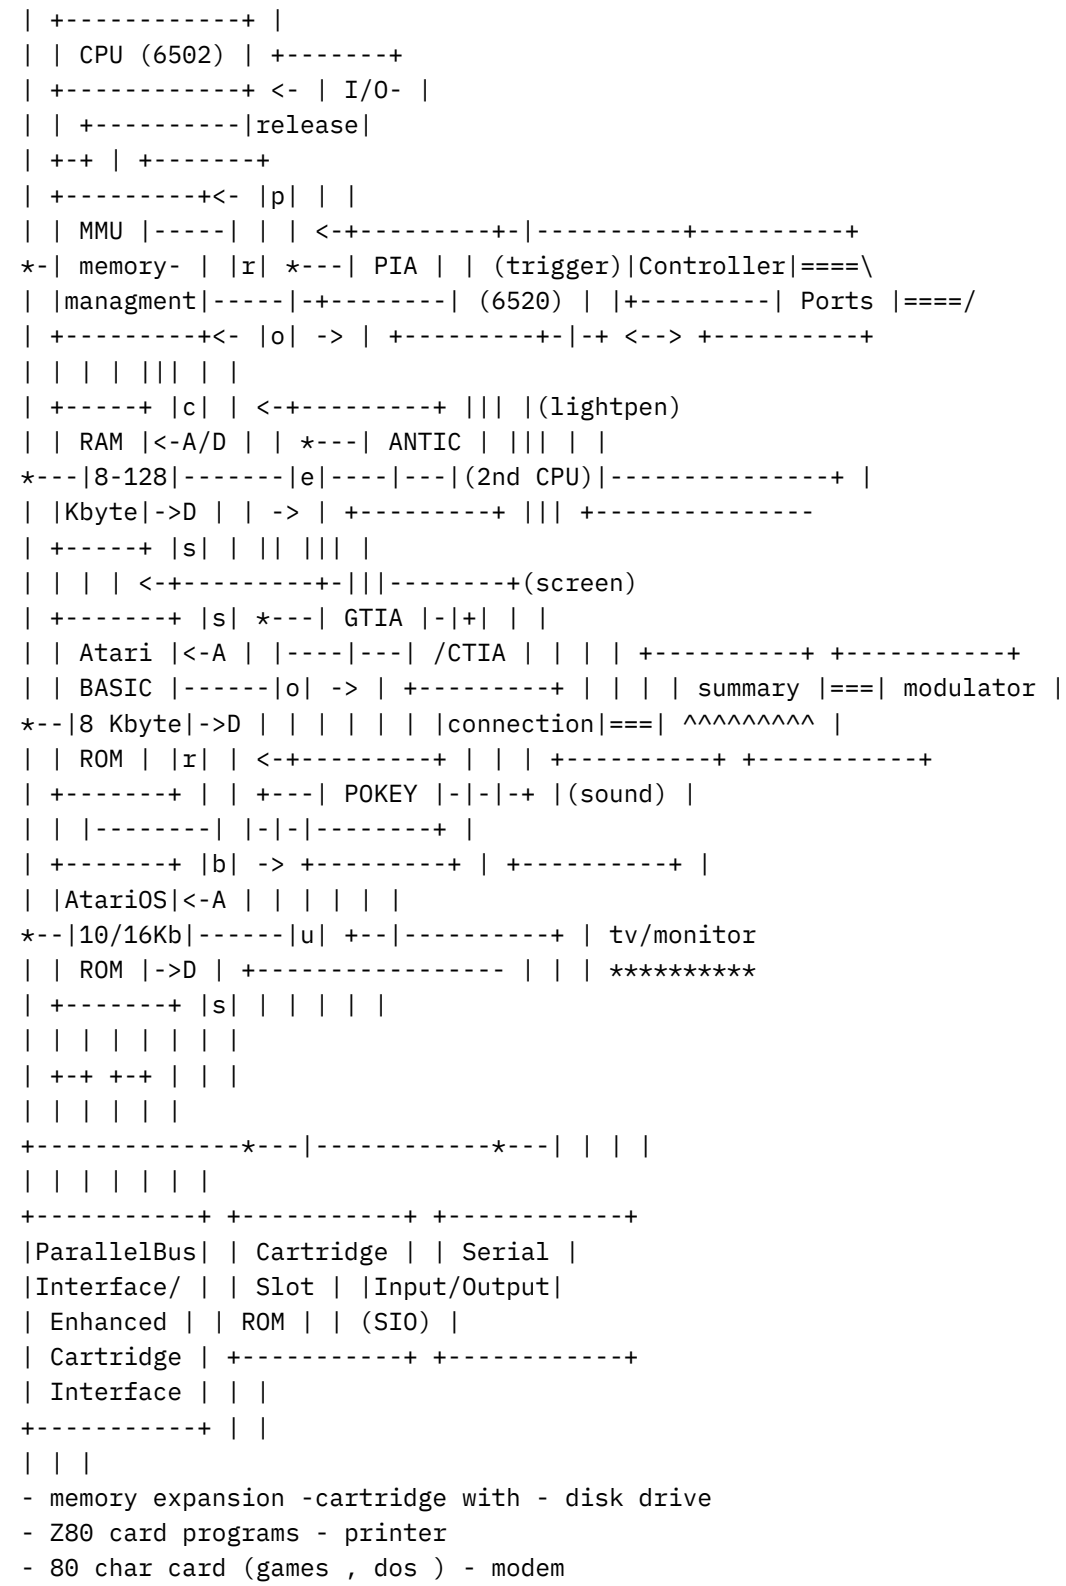
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.

->



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard

130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan
Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

According to Atari Explorer magazine, the 130XE was engineered by Jose Valdes.

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South
American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western
Europe, several South American countries, some Middle East and Asian
countries, several African countries, Australia, New Zealand, and other
Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz

Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari? Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it
from there. However, besides the GTIA PAL and NTSC machines differ in other
aspects. For example, on PAL machines an additional oscillator of 5/4 of the
main frequency is present to generate the color frequencies needed to drive
GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is
also the reason why you don't get "artifacted colors" on PAL machines (or, at
least, not very good ones.)

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,
or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the

monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari. Clarence Dyson has a nice page about such a project at http://www.geocities.com/atarimods/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. These are often known as a "VGA converter" or "Scan doubler" or "Up-converter." With such a device, the 8-bit Atari can be used with a standard PC VGA monitor. One such adapter is the Cheese Video Box from AV Toolbox, http://www.avtoolbox.com. AV

Toolbox produces several other similar devices. An earlier popular adapter was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs et Televiseurs - is a 21-pin universal connecting cable/socket system used for audio/video components in Europe. The cables transmit RGB, composite video, S-Video, mono and stereo sound. SCART, which is also known as PERITEL, EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in France, England, Germany, Switzerland, and Scandinavia. SCART is also very popular in the Russian Audio Video market. It is possible to interface the Atari's composite video signal, along with the audio signal, through a SCART connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

December 2003--More Than Games announced "A8 A/V BOB", an audio/video breakout box featuring phono connectors for composite video, chroma, luminance, and mono audio; it also features an s-video jack providing chroma and luminance. http://www.a8maestro.com/sites/mtgcat/mtgcat.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs and data on cassette tape. In addition to the digital track that stores computer data, a second audio track is provided to play music or voice as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain

Upgrades for the Atari Program Recorders
==
Andreas Magenheimer writes: (2004.05.24)
- turbo 6000: a turbo tape enhancement built in the former GDR (german democratic republic); it worked with 6000 Baud and required special loading/saving programs that were available as disk-files and also as cartridges;
Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

- turbo 2000: a turbo tape enhancement built in Poland or the former Czechoslovakia; it worked with different speeds (ranging from 600 Baud to approx. 9600 Baud?) depending on the program itself and the transfer program; also required a special loading/saving program, available as disk-files and cartridges;
For more information on the Turbo 2000 (T2000) and SuperTurbo modifications to Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

- rambit turbo tape: a turbo tape enhancement built in the UK by Richard Gore and sold by Microdiscount (Derek Fern); it worked with 9600 Baud and came with some special software on disk; Microdiscount also sold many of its own commercial programs (Zeppelin games, etc.) on Rambit turbo tape...

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12, generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

Unlike other microcomputer systems of the time, it was very unusual to use anything but Atari-brand program cassette recorders. One third-party product released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.
No second SIO port - must be at end of SIO chain.

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position where the program is located.

3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon
startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access

later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5/box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html
810 Duplicator (DT-Duplicating Technologies) -- copy disks, double-density,
"read 18 sectors in the time normally for 1"

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
(Happy Computers) Happy Backup. also read/write 180K 5.25" MS-DOS floppies

I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 57Kbps (Happy clone), 8kb buffer,
(Compy-Shop, now ABBUC) DOS, copier, track & density displays, beep speaker
Mini-Speedy same as Speedy 1050, but without displays & speaker
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses
(german Turbo) Sector skewing that differs from USDoubler)
1050 Duplicator (Duplicating Technologies (DT))
SS SD/ED/DD "read 18 sectors in the time normally for 1"
sources(Jim Patchell)http://www.oldcrows.net/~patchell/atari/duplicator.html
Klone ???????

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-
sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1,
TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM,
this results in rare compatibility issues. Specifically, these commercial
disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.

8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

Subject: 3.5) What other floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,
James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas
Magenheimer

SD=Single-Density, 90K/disk side
ED=Enhanced-Density, 128K/disk side
DD=Double-Density, 180K/disk side

SS=Single-Sided
DS=Double-Sided (one of 3 possible data-mappings, see below for details)

Printer port=has a standard DB25 parallel printer port,+ maybe a print buffer
Master=includes drive controller, can add additional,non-Atari-specific drives

Top transfer rate=19.2Kbps unless stated otherwise

Floppy disk drives designed for the 8-bit Atari computers:
Atari 810 SS SD
Atari 1050 SS SD/ED
Atari XF551 DS SD/ED/DD, 38.4Kbps burst mode
Access Unlimited ATAR88-1 SS SD master
Access Unlimited ATAR40-1 SS SD/DD master

Amdek AMDC I SS SD/DD uses flippy Amdisk III 3" disk/carts,printerport,master
Amdek AMDC II SS SD/DD dual drives, printer port, master
AS SN-360 DS SD/ED/DD
Astra 1620 SS SD/DD dual drives
Astra 2001 SS SD/DD dual drives
Astra Big-D DS SD/DD dual drives
Astra The One DS SD/DD, printer port
B&C 810 SS SD, optional Happy Warp Speed 52Kbps
Concorde C-221M SS SD/DD master
Concorde C-222M DS SD/DD master
CSS Floppy Board, for the Black Box, master, support PC 720K and 1.44MB 3.5"
drives, support PC 1.2MB and 360kB 5.25" drives,
also read/write 5.25" and 3.5" MS-DOS disks
see: http://www.nleaudio.com/css/products/floppy.htm
High-Density Disk Interface (HDI) by Erhard Puetz. a PCB, master
connect up to 4 standard PC high-density drives
Indus GT SS SD/ED/DD, Synchromesh mode usable with SpartaDOS X
and DOS XL only. 72Kbps under SpartaDOS X, 37Kbps under DOS XL. Z-80 cpu
RAM-Charger--expansion card contains 64K RAM + software, for CP/M support
Karin Maxi PBI/ECI device, master, WD1772 + 2KB driver ROM
DS formats use PC-standard 'head-first' mapping
L.E. Systems LEDS5-01 SS SD/DD master, 134.4Kbps, 800 only
CP/M expansion: 4MHz Z80, 64K RAM
L.E. Systems LEFDC-04 SS SD Four drives, copies a disk in 22 secs, 800 only
L.E. Systems LEFDC-08 SS SD Eight drives, copies a disk in 22 secs, 800 only

LDW CA2002 DS SD/ED/DD,19.2Kbps,70Kbps w/SpartaDOS. "Calif. Access"
Micro MainFrame MF-1681 SS SD/DD, printer port, 4K to 54K printer buffer,
hard disk firmware included, master, Z-80 CPU w/ 16K to 64K RAM for CP/M,
TRSDOS, MaxiDOS A, and OASIS. see: http://www.qnet.com/~dons/mmf.html
Micro MainFrame MF-1682 dual drives version of MF-1681
Percom RFD40-S1 SS SD/DD, master
Percom RFD40-S2 SS SD/DD dual drives, master
Percom RFD44-S1 DS SD/DD, master
Percom RFD44-S2 DS SD/DD dual drives, master
(80-track RFDs hinted at http://www.atarimagazines.com/v1n2/newproducts.html)
Percom AT88 SS SD, master
Percom AT88-S1 PD SS SD/DD, printer port, master
Percom AT88-S2 PD SS SD/DD dual drives, printer port, master
Rana 1000 SS SD/ED/DD, stand alone disk formatting
RCP 810 SS SD
San Jose Computer Special Edition 810 SS SD, optional Happy Warp Speed 52Kbps
SWP ATR8000 4MHz Z80, 16K RAM, RS232, master, printer port
or 4MHz Z80, 64K RAM, RS232, master, printer port, CP/M 2.2
options: 128K or 256K CO-POWER-88 with MS-DOS; CP/M-86
TOMS 720 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 70Kbps
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB

- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
- known as Toms-Turbo Drive, Turbo format and speeder is compatible
with german Engl-Turbo-1050; (tools will work with both drives);
TOMS 710 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 67Kbps
one more format: double sided, 80 tracks, IBM (720 KB)
also TOMS Navigator on ROM (like Norton Commander);
known as Toms-Turbo drive; Turbo format and speeder is compatible
with german Engl-Turbo-1050; (tools will also work with both drives);
Trak AT-1 SS SD/DD master.upgrade: printer port+4K/16K buffer
Trak AT-D1 SS SD master, printer port, 4K print buffer.upgrade:16K
Trak AT-D2 SS SD/DD master, printer port, 4K printbuffer.upgrade:16K
Trak AT-D4 DS SD/DD, printer port, print buffer
Trak Champ SS SD master
Trak Champ2 SS SD/DD master
Trak AT-S1 SS SD/DD slave
XFD601B DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat.
XFD602B dual DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat

While any standard "slave" drive will work with "master" drives listed above,
the following are slave drives marketed specifically to Atari users:
Access Unlimited ATAR88-A1 SS SD slave
Access Unlimited ATAR40-A1 SS SD/DD slave
Concorde C-221S SS SD/DD slave
Concorde C-222S DS SD/DD slave
Percom RFD40-A1 SS SD/DD slave
Percom AT88-A1 SS SD/DD slave
RCP 100 DS SD/DD, slave
RCP 200 DS SD/DD dual drives, slave

The following information is taken from the documentation for HiassofT's
WriteAtr program, http://www.horus.com/~hias/atari/

Double-Sided drives for the Atari may use one of three different drive-
mapping possibilities.
* Most double-sided Atari disk drives:
First fill tracks 0-39 (or 0-79) on the first side, then switch
over to side 2 and again fill tracks 0-39 (0-79 for 3.5" disks).

* The XF551 first fills track 0 on the first side. Then it
fills track 1, then track 2, ... up to track 39 (on a 5.25" disk)
or 79 (on a 3.5" disk). Then it switches to side 2 and fills
the disk in reverse order (starting at track 39/79, then 38/78,
... til it has reached the end of the disk at track 0).

* The third possibility is the standard in the PC world, but on the Atari
it's possibly unique to drives connected via the Karin Maxi interface.
If your Atari disk drive uses this mapping, it first fills

track 0 on side 1, then track 0 on side 2, then seeks to track 1,
again first fills track 1 / side 1, then track 1 / side 2,
and so on, until it finishes with track 39 (79) / side 2.
The drive switches the heads (sides) first before switching
the track.

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I mean you can't use high density disks. They must be double density to use with the 1050. Almost all double density 5 1/4" disks have a hub ring, high density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the type of oxide coating used on the high density floppy media; they cannot write reliably to them. The hub ring has just become a sort of marker to distinguish the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the really premium brands offered hubs to prevent slippage and out of round problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.7) What can I do to extend the life of my floppy disks?

Lee Hart writes (January 2004):

Personally, I have several hundred floppy disks for my Atari 800, Kaypro 4, Heathkit H89, and IMSAI 8080 computers that are 10-20 years old. What I can say in general:

- Most disks stored in plastic boxes or ziplock baggies survived.
- Most disks stored in cardboard boxes or just their sleeves did NOT survive.
- Some brands lasted better than others, but I haven't collated the information so as to make any kind of definitive statements.
- If a disk cannot be read, CLEAN THE DISK DRIVE HEAD before attempting to read another disk! Otherwise, crap from the bad disk will remain on the head, and will scar and destroy any SUBSEQUENT disk you put in the drive! (the voice of painful experience).

- For lack of a better plan, for each of my surviving disks I am:
a. reformatting another blank disk
b. copying the data from an old disk onto the blank disk
Then I have a more recently-produced backup disk in case the
original disk later fails.

Subject: 3.8) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options have been produced over the years. No common DOS version was written with drives the size of hard drives in mind, and very few 8-bit Atari users have owned hard drives for the Atari. Yet, if you're serious about it, a hard drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit Atari computers; the rest are interfaces designed to let you attach an industry standard SASI, SCSI, or IDE type hard drive. Customized software (OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.geocities.com/atarimods/atari.html
(Atari page by Clarence Dyson)

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE
Disk Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000
baud
- emulates Atari disks D1: to D8:
disk D1: can be swaped with Common disk D1: (HD1_ZW jumper)
- can be used with any Atari DOS and OS

- can be used without any problems with other SIO devices (disk
drivers, printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software
(changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'),
CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg)
can be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
- Long File Name (LFN) support for HDD
- TEST mode for checking HDD initialisation
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://atariarea.histeria.pl/sio2ide/

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: (= Trendcom Model 100)
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:

monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL
series computers.

Atari 1020 Color Printer:
(= Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /..; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)
- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the
Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE series computers.

Atari XMM801 Printer: (= SHINWA CP80)
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors
- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer
- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good

results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet
here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received, from modem to modem, via
standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit
computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)

Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial modem can work well with the Atari. These have been commonly sold for PCs for many years. The Hayes Smartmodem more or less defined the market for these, initially.

One common way to use an industry standard external serial modem with the Atari is to connect it to the SIO port via an Advanced Interface Devices (A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or equivalent.

The other common way to use an industry standard external serial modem with the Atari is to attach it through the 9-pin RS232C serial port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the serial port on the 850 is DB9 female, where the PC world ended up standardizing on a DB9 male connector for this purpose. But gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be useful to have an understanding of data flow control. Here is a definition of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than the other can receive. Flow control allows the receiving modem to tell the

other to pause while it catches up. Flow control exists as either software, or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established industry standards, Atari produced the 850 Interface Module to address this issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other devices can be used with the Atari computer in combination with an 850 Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on

the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks

CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man),2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC bk,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,incl disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE

1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives(controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European data in this section. I need more
international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

MPP1000C modem: 9 V DC 200 mA (1.8 W)

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and

Bug Hunt cart all in one package and b) in a separate package,
containing the Lightgun and the Bug Hunt cartridge); thats's why Bug
Hunt does not have its own package, it was always included with the
Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);
- Sega-Lightgun (normally not Atari compatible; but can be converted
into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun,
it is my personal impression, that the Atari lightgun merely works ok
on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun
works alright on TV's and (most) monitors. Since I never had a Best
lightgun I cannot comment on this one... (Andreas Magenheimer);

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair
of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair
of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other,
using only one port-connector (only one joystick port). Thus, with a pair
of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models
and up to 8 paddles (4 pairs) to the Atari 400/800 models.

Subject: 6.10) What voice/sound synthesis hardware was produced for the
Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare
Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by
National Semi Conductor);

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.
- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and gave you "another" monitor jack and 2 cinch connectors to connect to

the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes, frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL:)

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can playback any midi-sound via the Atari Pokey chip, nor any converter

program, which can convert *.MID sounds into other Atari sound formats
(that could be played back on the Atari then)...

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque
developed some networking-computer-hardware to link two or more Ataris
together, so that multiplayer games are possible, where each user has
its own computer and tv/monitor screen. The hardware was/is computer
independant and will run fine on any Atari 8Bit computer (whereas most
software for it will only work on XL/XE computers). During a 3-4 year
period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two
computers together via the joystick ports. It is limited to a maximum
of 2 computers and thus 2 or 6 players, meaning one free port per
XL/XE computer and 3 free ports per 400/800 computer. However, the
few existing games for this hardware merely support 2 players, no
matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8
computers together via the SIO-port. One computer will then act as
the master and has to boot up the software (from tape, disk, harddisk,
etc.) first. Then all other "slave" computers connect to it and boot
off of this master computer (one after another of course). In Europe
we call this device "Multilink", mostly because of the games written
by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms.
A two-computer link-network can easily be done with one SIO cable, just
open the end of the SIO cable and exchange cables number 3 and 5. You
now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer
hardware, see 8.16 which programs support networking computer hardware...

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced
project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules
video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

----

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm or
http://members.chello.nl/taf.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (taf.offenga [at] chello.nl (replace " [at] " with "@")

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

Rev.	TV	Date	CRC-32	Part Nr(s)
A	NTSC	(?)	(?)	(?)
A	PAL	(?)	0x72b3fed4	CO15199, CO15299, CO12399B
B	NTSC	(?)	0x0e86d61d	CO12499B, CO14599B, 12399B
B	PAL	(?)	(?)	(?)

XL/XE 16kB OS roms
~~~~~~~~~~~~~~~~~~

Rev.	System	Date	CRC-32	Part Nr(s)
10	1200XL	10/26/1982	0xc5c11546	CO60616A, CO60617A
11	1200XL	12/23/1982	(?)	CO60616B, CO60617B

2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.

400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between

these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
~~~~~~

example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge

C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System,
also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
Trivia: The "N. DEFINE DEVICE" menu option does not work.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
- DOS.SYS is loaded into memory from disk on startup
- DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. DOS 2.0S can read disks written with DOS 1; the reverse is not the case. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives. The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake. The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-

party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90. Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9). Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge

Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD
4.18 10-29-88 released by ICD

4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-

The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.
-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.

Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
==========
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
==========
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
==========
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
==========
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program
to set up the driver from BASIC. Later they shipped with a special version
of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM
chip inside the RS232 serial interface. A long beep is heard through the
speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading
this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari
computer is turned on with a P:R: Connection or powered 850 connected, but no
powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in
handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They
include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 8.1) What programming languages are available for the Atari?

This section is by Freddy Offenga.

Revision : 1.9
Date.... : 2004-3-30

==========
The goal is to give information about all available languages
for the Atari 8-bit computer. This information includes:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Maintainer: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")
URL : http://members.chello.nl/taf.offenga/atari.htm

==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer
- Winston Smith
- Carsten Strotmann

Revision history
================

1.9
- X-Assembler updated
- Added "QS FORTH" info from Winston Smith
- Added FORTH section work from Michael Current (thanks to Carsten Strotmann)
(see also: http://www.strotmann.de/twiki/bin/view/APG/LangForth)
- Several updates in the assembler section

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"
- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor

and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Assi (download)
version, year : 0.0.41, 2000
author/company : MacFalkner
available..... : http://members.aol.com/macfalkner/atariindex.htm
package..... : assembler, file linker
features..... : source include, data include, code relocation
Cross assembler for Win32. Source code is highly compatible with
Atmas for the Atari.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),

conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : 1.0, 13/12/1986
author/company : E.Reuss, Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from

the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 1.01, 1984
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAC/65 Macro Assembler (disk)
version, year : 4.20, 1994
author/company : Stephen D. Lawrow, Fine Tooned Engineering
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk)
version, year : 4.20 demo version, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : -
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for PC/DOS. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : 4.0, 1982
author/company : Steve Hales, Synapse Soft
available..... : http://www.atariland.com/members/oldatarian/
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.
An Adaptation by Steve Hales of the S.C. Assembler II.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : -
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- Xasm
version, year : 2.5.2, 2002
author/company : Piotr Fusik
available..... : http://xasm.atari.org
package..... : assembler, docs

features..... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC/DOS. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.05, 1987
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS

available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- CTH Fast Basic (disk)
version/year : ?
author/company : Tom Hunt/Closer to Home
avaiable.......: PD, Freeware or Shareware;
package........: language plus several test files
and examples; english docs;
features.......: faster than Atari Basic, not much
slower than TB, does not use Ram under OS;
avaiable at Tom Hunt's homepage or elsewhere...

- Der BASIC Compiler (?)
version, year : ?, 1983
author/company : Datasoft
available..... : ?
package....... : BASIC compiler
features...... : ?

- Frost BASIC (?)
version, year : 1.04, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Version of Turbo Basic XL that runs on 48k machines (400/800).

- MMG BASIC Compiler 2.0 (?)
version, year : 2.0, 1984
author/company : Special Software Systems
available..... : ?
package....... : BASIC compiler
features...... : ?
It appears that this is a newer version of Der BASIC Compiler,
licensed to some other company.

- TT-BASIC XL (disk)
version, year : 2.11, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Published in the German magazine "Happy Computer".

Appears to be a newer version of Turbo Basic XL.

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : umich archive,
http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?

package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package..... : ?
features..... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

- INTER-LISP/65 (disk)
version, year : 2.2, 1982
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ES-FORTH
version, year : 1.2, 1984
author/company : The English Software Company
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthESForth
package..... : ?
features..... : ?
Seems to be based on fig-FORTH, but with some unique "Words".

Works with normal DOS.

- Extended fig-FORTH, (disk)
version, year : 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- Extended fig-Forth (disk)
version, year : 1.1 Rev. 2.0, 01/15/82
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- fig-FORTH
version, year : 1/26/81 and 4/01/82 releases
author/company : Steven R. Calfee "Team FORTH"
available..... :
http://www.atariarchives.org/APX/showinfo.php?cat=unknown_fig
package..... : ?
features..... : ?

- fig-FORTH
version, year : 4/10/82
author/company : Peter Lipson / Robin Ziegler "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/1/82 release of fig-FORTH by Steve Calfee

- fig-FORTH
version, year : 5/5/82 - 10/16/82
author/company : Harald Striepe "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/10/82 release of fig-FORTH by Lipson/Ziegler

- fig-FORTH, Antic (disk)
version, year : 1.4S REV.H, 18Jun85
author/company : John Stanley/Antic Magazine "Team FORTH"
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthAntic
package..... : ?
features..... :
based on 10/16/82 release of fig-FORTH by Striepe

- fun-Forth (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package..... : ?
features..... : ?

- Grafik-FORTH
version, year : 1990
author/company : RAI Production
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthGraphicForth
package..... : ?
features..... : ?
based on fig-FORTH 1.4S and TURBO-GRAPHICS-SYSTEM 256

- MesaForth
version, year : 12/03/81
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthMesa
package..... : language, source code, documents, examples
features..... :
based on 6502 fig-Forth. The major difference is in the size of the
screen on disk (512 bytes instead of 1024 bytes).
Runs under ATARI DOS 2.0S.

- QS FORTH
version, year : 1.0, 3/27/81
author/company : James Abanese / [QS] Quality Software
available..... : http://www.strotmann.de/twiki/bin/view/APG/LangForthQS
package..... : Editor, Assembler, I/O routines
Single Density 5.25 Floppy and Manual in Binder
features..... : Editor, Assembler, I/O Routines.
based on fig-FORTH.

- Turbo-4th
version, year : January 1985
author/company : Steven R. Calfee
available..... : ?
package..... : ?
features..... :
compatible with fig-FORTH and Team FORTH. It's fast.
Not threaded, it is a true compiler

- ValForth (disk)
version, year : 1.1, 1982
author/company : Valpar International
available..... : ?
package..... : (8) disks in the set including: 1)master disk,
2)display formatter, 3)text compression and auto text formatting,
4)valDOS-I, 5)valDOS-II, 6)player-missile graphics, character editor and

sound editor, 7)general utilities and video editor, 8) Turtle &
valGraphics and advanced floating point routines.
features..... : ?
based on fig-FORTH

- X-FORTH
version, year : 26 Jan 2003
author/company : Carsten Strotmann
available..... : http://www.strotmann.de/twiki/bin/view/APG/ProjXForth
package..... : binary, source, disk image with samples & editor
features..... : aims to be compatible with new ANSI standard.
works with normal DOS.

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package..... : ?
features..... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package..... : ?
features..... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Extended WSFN, WSFN = Which Stands For Nothing
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package..... : ?
features..... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package..... : compiler, editor, library, sample game
features..... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 8.2) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)
Real Time Cartridge Sunmark, http://www.sunmark.com/

Subject: 8.3) What games support 4 or more simultaneous players?

Contributors to this section: Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat
Mulvey, Steven E. Posey (Party Quiz), Andreas Magenheimer, Florian Dingler,
Matthias

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- some more PD and commercial games...

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models sport 4 controller ports)

- Asteroids cart. by Atari,
- Basketball cart. by Atari,
- Dandy disk by APX,
- M.U.L.E. disk by Electronic Arts,
- Maze War disk or cart. by ???,
- Silicon Warrior disk or tape by Epyx,
- Survivor disk or cart. by Synapse,
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Volleyball by ???
(PD game written in Atari BASIC);
- Tank Battle by Fred Pinho from Antic magazine:
http://www.atarimagazines.com/v3n2/animate.html
- Roadblock by Brian Holness from Compute! magazine
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other
computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms? by Electronic Arts
(has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special
4-button keypad controllers linked together with RJ-11 jacks (standard
phone jacks) to a box with 2 joystick port connectors:

- PQ: The Party Quiz Game by Suncom

e) The following programs support multi-joystick games, using extra
hardware called Quadrotron (from the german Atari magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra
hardware called Multijoy (multijoy4 for up to 4 players, multijoy8
for up to 8 players and multijoy16 for up to 16 players; originally
developed by Raster/Radek Sterba, but also available from ABBUC):

- Cervi by R.Sterba (up to 8-players Snake-clone);
- Multijoy by R.Sterba (up to 4 players Tetris-clone)
- Bremspunkt by T.Butschke (up to 4 players Car-race);
- Sheeprace by F.Dingler (1 to 8 players Sheep-race);
- Cardgrabber by F.Dingler (2 to 8 players grab-a-card-game);
- Ice-Hockey by F.Dingler (4 to 8 players Icehockey-game);
- Quadrotron-M4 by R.Sterba (patched Quadro-Tron for Multijoy);
- Shoot Em' All by R.Sterba (16 players shooting-game)

The following are available at:
http://mitglied.lycos.de/gunnarbusse/bajamar/download.htm
- Asteroids, modified for Multijoy by Schmutzpuppe
- Basketball, modified for Multijoy by Schmutzpuppe
- Tennis, modified for Multijoy by Schmutzpuppe
- Dandy, modified for Multijoy by Schmutzpuppe
- M.U.L.E., modified for Multijoy by Schmutzpuppe

Subject: 8.4) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatible with models other than the
original Atari 400/800. Most probably do work on XL/XE's if you use a
translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase (by First Star Software) Parker Bros.
Atari Word Processor Atari
(this is not the same as AtariWriter!)
Atlantis (some versions!) Imagic
Attack at EP-CYG-4 (by Bram) Romox
Bacterion! Kyle Peacock/Tom Hudson/ANALOG#20
(http://www.cyberroach.com/analog/an20/bacterion.htm
patch for XL/XE available:
http://www.cyberroach.com/analog/an20/bacterion_patch.htm)
Bandits Sirius Software
BearJam Chalkboard
Boulders And Bombs CBS
Chicken Synapse
Dancing Feats (by Softsync) Romox
Demon Attack Imagic
Dreadnaught Factor, The Activision
Drelbs Synapse
File Manager 800+ Synapse

Forbidden Forest Cosmi
(later versions by different companies work ok on XL/XE!)
Fort Apocalypse Synapse
(cart version is 400/800 only! tape+disk versions work ok on XL/XE!)
Galahad And The Holy Grail APX
(Downloadable: http://www.atariarchives.org/APX/showinfo.php?cat=20132)
Go Hayden
Gorf Roklan
Jawbreaker II Sierra On-Line
Jet Boot Jack English Software
(can be found on various tapes/disks; at least the re-release
version by Byte Back works alright on XL/XE computers!)
Juggler IDSI
K-Razy Antiks K-Byte
K-razy Kritters CBS
K-razy Kritters K-Byte
Kangaroo Atari prototype
KoalaPainter Koala

Zaxxon (early release only!) Datasoft

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Andreas Magenheimer adds:

To get an overview or see a chart of OS changes from the 800 to the XL
line, refer to Antic magazine Volume 3, Number 2 (June 1984), pages 10-14;
(online: http://www.atarimagazines.com/v3n2/insideatari.html)
Also note, that some software will not work correct (or not at all) on
newer XE/XEGS versions (which have a new OS with a new version number,
a new selftest/memory-test/keyboard-test, larger RAM chips, etc. etc.);

Thomas Richter contributes further details (16 Jan 2004):

There are a couple of reasons why some games don't run on the XL/XE
models. I try to order them by "likeliness", of course biased by my
personal observations:

i) The printer buffer of the XL Operating System in page 3 is a couple
of bytes shorter. The additional bytes are used for extended OS
variables not available in the 800 series. Most prominent is the $3fa
location, holding a shadow register of GTIA's TRIG3 signal. While a
true joystick trigger line in the 400/800 series, this signal is used
as "cart inserted" signal for XL/XE models. Unfortunately, the OS
compares GTIA trig3 with the shadow register at $3fa in each vertical
blank, running into an endless loop if the register contents don't
match. This causes hangs for games using page 3 either as copy-buffer
or for player-missile graphics. (Hangs by Ms. Pac-Man and
Bacterion! are caused by this, and many others...) This is "fixable"
either by the translator disk, or by a quick hack into the game,
replacing the OS vertical blank or poking TRIG3 frequently into its
shadow. The reason for the OS behaviour might be that Atari wanted to
prevent crashes if the cartridge is inserted or removed while the
machine is running. The 400/800 is powered down when a cart is
inserted, the XL/XE lacks the cover of the older models that triggered
a little switch to interrupt the power line.

ii) Similar to the above, writes to $3f8. This OS equate defines
whether on a warm start, the BASIC ROM shall be mapped back in. If
its contents are altered, a program triggering a reset as part of its
initialization will find itself then with 8K less RAM occupied by
a BASIC ROM, making it crash. Similarly, writes to the cartridge checksum
$3eb could cause a cold-start on a "reset initialization". This is
fixable by the translator disk.

iii) Some games use a four-joystick setup, or at least initialize
PIA itself. If this happens inadequately, PIA Port B, bit 0 gets changed,

disabling the ROM, and thus crashing the machine. This is not fixable
by the translator since it is a hardware issue.

iv) Direct jumps into the OS ROM, not using the documented vectors in
the $e450 area. Interestingly, this fault is not as common as it may
sound since games hardly ever use the OS. It causes failures of
some "serious applications", most notably "QS Forth" and applications
compiled by it. This is fixable by the translator disk.

As a side remark, it is interesting to note that no such documented
jump-ins exist for the math-pack ($d800 to $dfff). It is not really
part of the OS, but looks more like a part of the BASIC interpreter
that didn't make it into the OS because there was no room left. Thus,
direct jump-ins have to be used here that are documented in the De Re
Atari (for example). Atari never changed them, but it seems likely
that this documentation happened more or less as an accident since the
same source also lists some mathematics-related jump-ins into the
Basic (namely, to compute SIN and COS and related) that are only valid
for the Rev. A BASIC. Thus, the math pack might be a couple of
routines that have been originally intended for "private use" of the
BASIC ROM, but then have been found "too useful" by many others to
remain "closed". Otherwise, it is hard to explain why the otherwise
pretty cleaned-up OS comes with a construction like this.

Subject: 8.5) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

- Bug Hunt cart. by Atari;
- Barnyard Blaster cart. by Atari;
- Crossbow cart. by Atari;
- Crimebuster cart. by Atari;
- Operation Blood disk by ANG/Mirage;
- Operation Blood II - Special Forces disk by ANG/Mirage;
- Light Gun Blaster (PD from Page 6);
- enhanced Lightgun Blaster (PD from Pedrokko);
- Gangsterville disk by Linda Soft
(an italian game written in BASIC);
- maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
All Lightgun games can be used with a lightpen (which is not as accurate
as a Lightgun however). And all lightpen programs can be used with a
lightgun. thus add:

- Atari Graphics cart. by Atari
(a painting/drawing program);

- Matrix a PD game by Dave Oblad
(a 4-wins or 5-wins clone!)
- Alien Invaders disk by R.Gore (available from DGS);
- Bembelwo a PD game by Thorsten Butschke
(a sort of golf/minesweeper game, written in Quick);
- Sharp Shooter by Mat*Rat a PD game from Analog,
(also available on cart from Video 61/Lance Ringquist);
- Lightgun Shooter by ??? from ABBUC mag.
(a simple shooter game, at least PD!)
- Flyshot or Flyshoot a PD game by Kemal Ezcan
(a Turbo BASIC game from ZONG, the KE Soft magazine);
- Geisterschloss game+editor disk by KE Soft;
- Lightpen Doodle by ??? from Antic magazine;
- some more PD programs and utilities for Lightpen or Lightgun;

Subject: 8.6) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
------------- ---------------------
- Missile Command by Atari CTRL-T
- Slime by Synapse [T]
- Shanghai by Activision choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
- Bombdown by Roemer of Uno choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
- Minesweeper by Raindorf-Soft use an ST mouse in port 2
- The Brundles by KE-Soft use an ST mouse in port 2
- The Brundles Editor by KE-Soft, PD use an ST mouse in port 2
- Geisterschloss by KE-Soft, PD choose Lightgun (port 1) or ST
mouse (port 2)
- Vanish (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Hong Kong (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Maus-DOS (ZONG 5+6/1993); use an ST-mouse in port 2
- Faecher-Patience (ZONG 1/1993); use an ST-mouse in port 2
- Macao (Zong 5+6/1994); use an ST-mouse in port 2
- Multi-Mouse manager (PD) drivers for mice, TB, etc.
- Multiplayer 2.1 by Madteam supports ST + Amiga mouse in port A
- Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
- Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
- little Calculator (AMC-Verlag, PD) uses ST-mouse only (port 2)
- big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to

use to *.EXE; all drivers use port
1 - if I remember correctly)
- Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine) uses an ST mouse in port 2
- Diamond GOS (Reeve software) all three versions support an ST
mouse in port 2
- S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port 1
- BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions available... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC available. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, Germany).

Subject: 8.7) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- One on One (Compute!) a breakout/warlords clone
- Paratroop Attack by David Plotkin
- all Pinballs created with the P.C.S.

(use left paddle trigger for left flipper and right paddle trigger for
right flipper; or simply use a joystick and left/right/fire button);
- many more Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

for Koala Pad only: - Micro-Illustrator / Koala Painter
- other Koala Pad painters or programs

Subject: 8.8) What programs have a CX85 Numerical Keypad mode?

Andreas Magenheimer contributes:

- Bombdown (Roemer of Uno);
- The Bookkeeper (Atari);
- Multi mouse Management (PD);
- UPN calculator (PD);
- Ball Harbour (Zong 8/1992);
- The Big Quest (Zong 7/1992);
- Blob (Zong 2/1992);
- Bomber Jack (KE-Soft);
- Catch (Zong 6/1992);
- Code table (Zong 11+12/1993);
- CX-85-Driver (Zong 7+8/1994);
- CX-85-Keycode-driver (Zong 7+8/1995);
- Donald (by KE-Soft);
- Drag (by KE-Soft);
- Dragon Fire (Zong 1/1993);
- Gravitar (Zong 4/1992);
- Hungry Goblin (Zong 5/1992);
- Invaders (Zong 5+6/1993);
- Joshi (Zong 3+4/1993);
- Lasermaze (by KE-Soft);
- Lost in the Antarctic (Zong 2/1992);
- Mampfman (Zong 8/1992);
- Minipac (Zong 3/1992);
- Minipac 2 (Zong 6/1992);
- Money Raider (Zong 2/1992);
- Monster Tracking (Zong 9/1992);
- Oblitroid (by KE-Soft)
- Pac-Man (Zong 11/1992);
- Schlumpf/Smurf (Zong 5/1992);
- Slurp (Zong 3/1992);
- Techno Ninja (by KE-Soft)
- Transsylvania (Zong 3+4/1993);
- Viro-Mania (Zong 2/1993);
- Zador XL (by KE-Soft)
- Zador II (by KE-Soft)
- many more games from KE-Soft and Powersoft;
(forgot their names, help needed!)

Subject 8.9) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- Musorqua (Analog computing) educational program
- many more (which I do not remember right now!)

Subject: 8.10) What kinds of RAMdisks can be set up on the Atari?

This section by Andreas Magenheimer.

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.10 from October 2003]

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM extensions and enhancements, just to save some money. Also a lot of firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or manuals, but gives some info about the various Ramdisks on the market. Since these notes are written by me, they will merely contain the information I have. And as you all can see - it is still incomplete. So any help and extra info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard convention
as the majority of ramdisk users don't want bit 4 counted as a control bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the 'on'
bit for ANTIC's access to the extended memory for 'compatible' (to 130XE)
machines as well. If bit 5 does show up in a bit use table, one can only
assume that this is an incompatible machine which doesn't have or use ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF 2,3,? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 512k XL various authors 448k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23;
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
The new version will replace the 64k main RAM with 512k RAM, thus
you gain 64k RAM and 448k Ramdisk. (A.M.: Afaik, it has the same

problems as the 256k RAM enhancements [with 64k RAM and 192k Ramdisk],
meaning *some* programs will try to use the main RAM as rambanks...)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes a Basic test program!);
bugfixes and updates in Atari Magazin 3/1987, 4/1988 and 5/1988;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (not built-in), Antic access: no! ;

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 1,2 => 512k B.Pahl 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,

83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: upgrade for Megaram 1 or 2 to 512kbytes (which means
a total of 576kbytes memory); requires a small pcb (in
connection with the existing Megaram 1 or 2 pcb) and the
following chips: 2x 414256 (RAM), 1x 74LS138 plus some more
wires inside the computer; additionally one may install a
switch to switch down to 320k or even 64k (no RD!) if needed;
advantage: more RAM, Basic still there, 26AE & 8ACE banks...;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one 74LS08 chip (see ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to
select the internal Basic, connect a toggle switch between ground
and the motherboard where PB1 was removed (PIA `Hole' 11). The
switch is not much different than the Option Key, and I found it
more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7;
Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or
selfmade ones...) most likely do NOT have Antic access, due to
the lazyness of its creators or their intentions of simply not
needing it. However, original Newell Ramdisks created and sold
by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)

F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by
FTE; seems to be very incompatible to existing software and
bankswitching cartridges (OSS, Atari, etc.), because normal RAM at
4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one
PIA chip there is simply no bit left to switch between main RAM and
extra RAM / Ramdisk. But with the installation of a second PIA chip
one would be able to do so. Furthermore one may use (almost) any
setup or banks he likes then (with a second PIA chip one could
control up to 256 Megabytes of RAM). Basic: To be able to select the
internal Basic, connect a toggle switch between ground and the
motherboard where PB1 was removed (PIA `Hole' 11). The switch is not
much different than the Option Key, and I found it more versatile.
(Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs.
It requires moving the OS into RAM before any banking of that Bit
occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell)
Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;

Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

- Rambo=>512k Dan Schmid 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 00,04,08,0C,20,24,28,2C,40,44,48,4C,60,64,68,6C, (Basic
80,84,88,8C,A0,A4,A8,AC,C0,C4,C8,CC,E0,E4,E8,EC; on??)
Notes: this "project" should upgrade a Rambo XL to 576kbytes;
the docs were found on Pooldisk Too (SUBDIR: ACE/Acec202 a+b);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- Satantronic`s 1MB PC-SIMM Ramdisk 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: should be compatible to Newell & S.Peterson (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no (?)

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI
with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one
wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)
D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 20th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

Subject: 8.11) What programs support a RAMdisk?

This section by Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.10 from October 2003)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) 128k;
b) XE-RDs (selfmade drivers!) 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) 128 kbytes;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;

(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to 64 kbytes;
b) Axlon-RDs (selfmade-driver!) up to 128 kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to 128 kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-driver for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-Ramdisk;

- ABBUC-Magazine-Intro 52 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(has different intros on 64k / 128k machines!)

- ABBUC-Magazine-Intro 55 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(with different intros on 64k / 128k machines!)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 320k 26AE = YES!, 8ACE = ???;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (hex.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.
with TurboDOS up to 256k, with MyDOS or Sparta maybe up to 1 Megabyte)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Mate II (Tool) Hybrid Arts;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);
- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
Bernhard Pahl and Mathy van Nisselroy for sharing some info with me.
Any further help or info is welcome !! -Andreas Magenheimer.

Subject: 8.12) What programs require a RAMdisk?

This section by Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.10 from October 2003]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);
(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that
supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- APC-Archiver 1.0 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- APC-Packer 1.1 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- Atari Writer Plus Super Menu Ken Siders;
a) AWP + Super Menu 128k RAM 130XE-Ramdisk;
b) AWP-XE + Super Menu 256k RAM 26AE = ???, 8ACE = ???;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;

(the standard system is configured for a 16MB harddisk partition,
however it is possible to change this and use an Atari with a big
floppy drive and/or ramdisk; but this requires quite some work!)

- Audio/Studio Master ANG/Mirage;
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Boot-Majster (TOOL) Electron;
128k RAM 130XE-Ramdisk;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Computer Baseball (GAME) Douglas Blackwell
128k RAM 130XE-Ramdisk

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!, 8ACE = YES!;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = YES!, 8ACE = YES!;
(this game comes in 3 separate versions; plays good on 64k
computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koala Slideshow XE (TOOL) Charles Johnson/Analog
128k RAM 130XE-Ramdisk

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh bugs!)

- Masher-XE V1.0 ??? (author unknown);
minimum 128k RAM 130XE-Ramdisk;
192k, 256k and max. 320k RAM AE, ACE and max. 8ACE RDs;

- Memdrv10 (RAM-Tester TOOL) Andre 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Menu 130 (TOOL) Les Howarth/Page 6
128k RAM 130XE-Ramdisk

- Midi Mate III Hybrid Arts;
128k RAM 130XE-Ramdisk;

- Minesweeper 1-4 (GAMEs) J.R.Chiko/S.A.S.;
128k RAM (4 game versions) 130XE-Ramdisk

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent;
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent;
320k RAM 26AE = ???, 8ACE = ???;
(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM minimum 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse;
192k RAM minimum 26AE = ??? , 8ACE = ???;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Protracker 1.5 (TOOL) MadTeam;
128k RAM minimum 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- Sample-Art-XE Mozart/WSL
a) minimum 128k RAM 130XE-Ramdisk;
b) more than 128k RAM 26AE = ???, 8ACE = ???;
(on my 576k-XL the program has some gr.-bugs and crashes very often!)

- Shrink-XE Peter Fitzsimmons;
min. 128k RAM 130XE-comp.-Ramdisks;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Studio/Audio Master ANG/Mirage
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Text-130 (TOOL) B.Russmann;
128k RAM 130XE-Ramdisk;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias;
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus;
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of) Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- (X-Files) Animation-Demo Mad Team;
128k RAM ($04 banks / $4b frames) 130XE-Ramdisk;
(the real name of this demo is unknown to me; maybe it is also called
X-Files-Demo, like the X-Files (picture) demo by Sphoon, maybe it has
a different name; on all tested XL/XE Ataris this demo has graphic bugs)

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (maybe Mad Team?);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS, etc.);

(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Critical-Sound-Demo Innovative;
128k RAM 130XE-Ramdisk;

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: The Wormhole Magic Arts;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;

c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are 2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!
this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- The Wormhole Magic Arts;
320k RAM 26AE = YES!!, 8ACE = NO!!;
(this demo is part of the Halle Project 1994 demo, side B!)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;
(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Too-Hard-4 Animkomials (Rippers!);
320k RAM 26AE = YES!!, 8ACE = YES!!;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert, Bernhard Pahl and Mathy van
Nisselroy for sharing their info with me. Any corrections and/or updates
are welcome... - Andreas Magenheimer

Subject: 8.13) What voice/sound synthesis software is there for the Atari?

This section by Andreas Magenheimer.

- S.A.M. - the Software Automated Mouth by Don't Ask Software (a
software package; you can find it at Don`s / the author's homepage:
http://www.retrobits.net)
- Softsynth (a PD program, that creates sounds and sound effects via
modulation of the tv/monitor speaker; available from the ABBUC library);
- MOD-Sounds (sound-MODulation, allthough I do not know any software to
create such sounds on an A8, some programs to edit (Protracker) and
playback (Inertia, Modplayer, Neotracker, etc.) these sounds do exist);

Subject: 8.14) What programs support stereo and upgraded sound?

This section by Andreas Magenheimer.

There is already a lot of stereo software for the upgraded Atari computers available, of course most of these programs are limited to certain/special upgrades and merely perform their stereo effects on these items (with otherwise upgraded or non-upgraded Ataris, the sounds or programs will only play in mono):

a) software for the various stereo-upgrades:

- stereo with one Pokey (POPS-software): Afaik for this kind of upgrade, there merely exists a patched version of the Pokey player program, I am not sure if there is anything else for it; anyway, refer to Analog Computing, issue 66, november 1988, pages 54 -60;

- stereo with two computers (thus two Pokeys): Afaik for this simple trick there merely exist two programs, they are "Perestroyka" and "Sky Network" by T.Liebich. In order to achieve the stereo effect, you have to boot/load one of these demos on two computers (connected to different TV's or monitors, there is no need to connect the computers to each other!). When done, press 1-5 on the first computer while pressing Shift-1-5 on the second computer. Meaning, if you want to hear the first sound in stereo then press 1 on computer 1 and press Shift-1 on computer 2 simultanously (that`s a little tricky, I know). If you want to hear sound 5 in stereo, then press 5 on computer 1 and Shift-5 on computer 2 simultanously. Tricky at first, but sooner or later you will get the hang of it. Of course you can also connect the two Ataris to a hifi-system, using the sound output of one Atari for the left channel and the sound output of the other Atari for the right channel...

- stereo-sound with Stereo-Blaster Pro (Portronic/AMC): Afaik there was at least one demo disk (early version was single-sided only, later versions were double-sided), that contained some demo-software, namely the simple "Stereo-demos" (by AMC, side 1) and the "Stereoblaster-Demo" (by HU-Soft, side 2 if available). The Stereoblaster demo was written in Turbo-Basic and played back via Compiled-Turbo-Basic, it uses Chaos Music-Composer Sounds (*.CMC) and a few of these provide stereo effects, if equipped with a stereo-blaster-pro and a hifi-system. The simple stereo-demos included some programs written in Atari Basic, for example a (pong-like) bouncing ball and a flying helicopter. Equipped with a stereo-blaster-pro and a hifi-system, one could see the ball bouncing left and right and simultanously hear the sound fx on the left or right channel. The helicopter started at the left side and produced a loud sound on the left channel, when it was flying to the right side, the sound faded on the left channel and got louder on the right channel, until the helicopter disappeared (and the sound completely faded away). There were some more of these simple demos available, but I don`t remember them anymore.

- Stereo with two Pokeys: There already exist dozens of sounds and demos, that support this upgrade, most of these programs were made in Poland, but a few sound-demos were also made in other countries. Anyway, the following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;
(there are at least two AMS-stereo-players, that let you play
*.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from
Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);
- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- (many) *.CMC sounds created by one of the many stereo-versions of
Chaos Music Composer;
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Dynakillers (Game) by GMG, Slovakia;
- First of All (sound) by Raster, Czech Republic;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- (many) *.MPT sounds created by the stereo-version of Multi Protracker;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Raster Music Tracker 1.x by Raster, Radek Sterba (a PC program
that creates mono/4-channels or stereo/8-channels *.RMT sounds that
can be played back on the A8 or any Atari 800/XL/XE emulator);
- (most) *.RMT sounds created by Raster Music Tracker;
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);
- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Still Alive (TMC-sound) by Greg, Poland;
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- (most) *.TMC sounds created by Theta Music Composer;
- Vanity sound by Kuchara / Excellent (Poland) ;
- Worms (320k-Demo) by Datri, Czech Republic;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)

(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

b) software for other sound enhancements:

- enhanced-sound with Covox: Afaik this upgrade will playback digitised or sampled sound in 8Bit resolution rather than in 4Bit resolution. The following programs support the Covox-Upgrade:
- Inertia 2.9, a MOD-player by MadTeam;
- Inertia 4.5, a MOD player by MadTeam;
- Protracker x.x, a MOD-editor and player by ???;
- NeoTracker 1.x, a MOD+NEO+... player by EPI/Allegresse;
- that's all I have found so far;
note that all programs (except neo-tracker?) will still work with pokey...;

Subject: 8.15) What games support online action via modem?

This section by Andreas Magenheimer.

- Modem Chess, a PD game in Basic by ???
- Modem-Battleships, a PD game in Basic by ???
- Tele-Chess, a PD game in Basic by ???
- probably some more games...

(I have also seen an advert from GCP in Analog or Antic, that listed the following games: The City, Cybertank, Cybership, Bio-War, Lords of Space; I am not sure if they are all available for the Atari, A.M.)

To play these games online, one would not only require an Atari computer, but also a modem, a modem-driver and/or a terminal program (like Kermit, Bobterm, Teleterm, A-Term, Ice-T, BBS Express Pro, etc.). See also the sections 7.8, 10.1 and 10.2 which tell you more about modem/terminal programs and modem hardware for the Atari...

Subject: 8.16) What programs support Atari computer networking?

This section by Andreas Magenheimer.

There are two different hardware add-ons which provide a "computer-network" (two or more Ataris linked together). Thus, there is software that supports either one or the other hardware (namely Gamelink-1 or Gamelink-2). The following software supports the networking hardware:

- Gamelink-1 (by Dataque):
- info-text about GL-1 and where to buy it, by Dataque;
- Tic-Tac-Two by J.Potter/Dataque, a tic-tac-toe clone;
- Modem-Battleships, patched by Rick Detlefsen for Gamelink-1;

- Gamelink-2 / Multilink (by Dataque & Bewesoft):
- info-text about GL-2 and where to buy it, by Dataque;
- info text about Maze of Agdagon demo, by Dataque;

- Maze of Agdagon demo (1 player only) by Dataque;
- documentation for Maze of Agdagon (full version) by Dataque;
- Maze of Agdagon (full version, 2-8 players) by Dataque;
- description of multilink/gamelink-2 hardware and schematics by Bewesoft (two texts, one in czech and one in english; schematics presented as an Atari Gr.8 picture for a) easy-2-computer hardware and b) more complicated 2-8 computer hardware);
- Multi-Dash (2-8 players, XL/XE only) by Bewesoft;
- Multi-Race (2-16 players, XL/XE only) by Bewesoft;
- description of "how to program networking games for multilink [gamelink-2] hardware" (text available in english and czech, with lots of source codes and OS adresses/variables/...) by Bewesoft;
- Multi-Worms (2-8 or 2-16? players, XL/XE only) by Bewesoft;
- complete + documented source code for Multi-Worms by Bewesoft;
- "starter-kit" module to use in your own networking-games by Bewesoft (free use of this module is granted by Bewesoft/Jiri Bernasek);

Subject: 9.1) How can I work with .arc files on my 8-bit Atari?

ARC.EXE for MS-DOS was released by System Enhancement Associates (SEA) around 1985. It will compress and store groups of files as one file, making it easier and quicker to download programs and support files at once. Because of the ease of use and availability of this program, it quickly became the defacto standard for file archives on Intel-based IBM machines. Files compressed and stored with ARC or a compatible utility are normally given the filename extender ".arc".

The 8-bit Atari computers have several software utility options that are fully compatible with ARC.EXE, the most important being:

Super UnArc 2.4 and Super Arc 2.4 - shareware by Bob Puff, released 01/31/89
Available:
http://www.nleaudio.com/css/files/superarc.arc (complete package + docs)

Also, SpartaDOS X includes a fully compatible ARC command for both creating and extracting .arc files.

Subject: 9.2) What file formats for entire disks/tapes/cartridges are there?

It is now common, especially when working on Windows PCs or Macs, to work with Atari software as files or "images" containing the data from an entire disk, data cassette, or cartridge as duplicated from the native media for the Atari.

Here is a list of file formats, arranged by their associated filename extensions. These are all filename extensions used to name files containing entire 8-bit Atari floppy disk images, cassette tape images, or cartridge images.

.DCM -Image format invented by Bob Puff for his Disk Communicator 3.2 utility. Used when working with native Atari hardware.

DISKCOMM is at http://www.nleaudio.com/css/files/DISKCOM.ARC
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

.ATR -Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer
platforms. SIO2PC is at http://www.tcainternet.com/wa5bdu/

.XFD -Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.
Xformer is at http://www.emulators.com/

.PRO -Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.
APE and APE ProSystem are at http://www.atarimax.com/

.SCP -SpartaDOS SCOPY image file. SCOPY was a utility by ICD.

.DI -Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

.CAS -Cassette image format invented by Ernest R. Schreurs, for his
Digital Cassette Image system (includes CAS2SIO, WAV2CAS, and CAS2WAV
MS-DOS utilities. See: http://home.planet.nl/~ernest/

Atari Disk Image FAQ (Steve Tucker)
http://www.atarimax.com/ape/docs/DiskImageFAQ/

One tool for converting among all of these disk image formats is:
Acvt v1.07 by Jindrich Kubec, found at http://jindroush.atari.org

---

Subject: 9.3) How can I copy my copy-protected Atari software?

Russ Gilbert writes:

Almost all commercial software for the A8 is/was copy protected. For boot
disks, this usually involved a large number of special formatting that
couldn't be copied using ordinary sector copiers. Usually the boot process
involved checking to see if a certain sector error occurred, then proceeding.
If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of
memory and see if the value changed. If the value changed, the cart program
was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at
which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption,
which must be decrypted before the program can run. This to make more
difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE ProSystem, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 10.1) What programs can log in to other computers via modem?

Here are some of the more popular PD/freeware/shareware terminal emulator and related programs available. Use one of these programs for accessing a dial-up Bulletin Board System (BBS) with your Atari, or for accessing a dial-up "shell account" with your Internet Service Provider (ISP). Dial-up shell accounts are no longer widely available here in the 21st century! (There is no general-purpose PPP capability for the 8-bit Atari that I am aware of.)

ATAR-Z-MODEM 1.2, 5/29/94, shareware by Larry Black
Emulates: n/a
Text: 40 columns in gr.0
File Xfer: ZMODEM download
Autodial: No
Backscroll buffer: No
Capture-to-disk: no
Summary: Intended to be used as an external ZMODEM receive utility in conjunction with other terminal programs, especially BobTerm
http://www.umich.edu/~archive/atari/8bit/Telecomm/Protocols/atzmod12.arc

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/FLICK051.ARC

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)

Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
Available: http://www.cs.huji.ac.il/~itayc/

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: k65v37.arc ; k65doc.arc - docs ; k65src.arc - source

OmniCom by CDY Consulting (David Young)
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit
filename: omnicom.arc

PabQwk 2.0, 1 Feb 1994, shareware by Low-Budget Productions (Pab Sungenis)
Requires: 128K XL/XE
Emulates: n/a
File Xfer: QWK upload/download
Summary: The Professional QWK reader for the Atari 8-bits. (QWK is a
packet format created in the IBM BBS community for reading mail
offline.)
http://people.a2000.nl/becotel/archive/pabqwk20.arc

Term80 1.6 (8.25.95), by CTH Enterprises (Tom Hunt)
Requires: MIO or Black Box
Emulates: ANSI
Text: 80 columns in gr.8
File Xfer: XMODEM receive, YMODEM send/receive
Autodial: Yes
Brackscroll buffer: No
Capture-to-disk: Yes
Summary: Designed for calling IBM ANSI BBSs at the highest possible
speeds supported by the MIO and Black Box (14.4 Kbps)
Available: http://cth.dtdns.net/Featured/term80/term80.html

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed

filename: vt850b1.arc

Subject: 10.2) What programs can I use to host a BBS on the Atari?

The 8-bit Atari was particularly popular for hosting a dial-up Bulletin Board System (BBS). Uploading/downloading files, online messaging, even online gaming services can all be hosted on an 8-bit Atari operated as a dial-up BBS.

This section attempts to list all BBS programs for the Atari. Of these, BBS Express! Professional and Carina II BBS seem to be programs that stand up well even today.

Contributors to this section include: Winston Smith, Steven Sturza, Chad Hendrickson, Don Fanning, Matt Singer, Pete Davis, Jeff Williams

o AMIS BBS -- The Atari Message Information Service, public domain.
The "granddaddy" of BBS programs for the 8-bit Atari.

The AMIS BBS was written in BASIC by people from the Michigan Atari Computer Enthusiasts. It included designs for a ring-detector. You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Several versions of AMIS:
* Standard AMIS
* MACE AMIS - from the Michigan Atari Computer Enthusiasts
* Fast AMIS
* MPP AMIS by Matt Pritchard
* TODAMIS 1.0, for 1030/XM301, 1986, Trent Dudley

o ATABBS -- Rod Roark writes (3/12/03):
This is really straining my memory -- don't recall exactly when I wrote the thing (maybe '80 or '81), but as far as I know ATABBS was the world's first BBS for the Atari 400/800.

I ran it out of my condo in Atlanta on a 48K 400 with an 80K floppy drive and a 300 bps Hayes Smartmodem. The 48K memory module was a third party add-on, not Atari's.

It was written in Atari BASIC with a few bytes of machine language thrown in.

o ATKeep -- An Atari 8-bit version of CITADEL BBS, by Brent Barrett
ATKeep is a Citadel-like BBS system for eight-bit Ataris. ATKeep runs under SpartaDOS and requires BASIC XE and 128K of RAM. Originally "MBBBS (Message Base Bulletin Board System) 1.0, March 24th, 1986" MBBBS was changed to Atari Keep, or, ATKeep for short, around version the time version 4.0 was released (June 15, 1986).

ATKeep 7.0 finally took the aide and cosysop commands out of a menu section and put them into extended commands, where they belonged. It also added a SYSOP level command set. Users were no longer "users" "aides" or "cosysops," they had become level "A" (SYSOP) through level "Z" (READ ONLY). The system

had become extremely complex. Public, hidden OR password protected PRIVATE rooms. Each room now had its own access level (thus keeping people of lower level from getting in EVEN if they knew the room name). Each room was assigned a RWRT (or Read WRiTe status), which determined who could enter messages in it, and whether or not public or private messages, or both were to be allowed.

Before version 7.0, ATKeep only worked with the Atari 1030 or XM301 modems. ATKeep 7.0 was rewritten to accomodate the 850 or PRC interface allowing use of any Hayes compatible modem.

ATKeep version 7.50 was released (1987), was version 8 released?

o BBCS -- Bulletin Board Construction Set, by Scott Brause/Antic, 1985
A machine language program, developed as the Jersey Atari Computer Group (JACG) BBS system.

BBCS was known for it's great flexibility. The sysop was offered easy customization by the use of menus. Many BBSes before it required that you had to actually change the BASIC code in order to customize your BBS.

Unfortunately, it also suffered from a reputation for stability problems.

o BBS Express! -- 1986, Leith Ledbetter/Orion Micro Systems
Written in compiled Action!. 1030/XM301 and 850 versions.

o BBS Express! Professional ("Pro!")--6.0b 1999, Lance Ringquist/Video 61
Originally by Keith Ledbetter/Orion Micro Systems.
See also http://cth.dtdns.net/pro/pro1.html

Written in 100% machine language.

Requires XL/XE, SpartaDOS 3.2+, hard drive highly recommended, or at least a large ramdisk. R-Time 8 is fully supported.

o Carina II BBS -- v2.7 (1995), David Hunt/Shadow Software
Carina II was originally developed by Jerry Horanoff.

Requires an XL or XE computer, at least 500K of storage capacity (including ramdisk and drives), and SpartaDOS version 2.3 or greater.
Recommended: 192K ramdisk or greater, and an R-Time cartridge.
Fully supported: An MIO interface and a hard drive.

More Carina II information and links:
http://jybolac.virtualave.net/carina/

Pete Davis writes (15 Aug 2002):
Carina was a pretty powerful BBS system. Though it was written in BASIC (with a number of machine language routines), it was expandable and had was able to load new BASIC programs with the BBS running. In fact, it was quite modular and would load different sections of the BBS at runtime. I actually used it when I ran a BBS some time back.

o Carnival BBS -- essentially AMIS with an overlay to allow for private messages and passwords.

o FoReM BBS -- Friends of Rickey Moose BBS. By Matt Singer.
At the time, there were a lot of BBSs around called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSs that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FoReM XL BBS -- by Matt Singer.
FoReM BBS updated to take advantage of BASIC XL from OSS.

o FoReM XE BBS -- by Matt Singer
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes).

o FoReM XE Professional BBS / FoReM XEP BBS -- by Len Spencer
A re-write of FoReM XE BBS, last version was 5.4, Jan 5 1993.
FXEP requires an XL/XE computer with at least 128k of memory, the BASIC XE cartridge from OSS/ICD, SpartaDOS 3.2 (this program will NOT work with any other version), and at least 500K of storage.

FXEP is in the public domain, http://members.aol.com/lenspencer/

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area.

"1983: Nite-Lite B.B.S. goes on the air. (Was it running A.M.I.S. ?) It is called "Nite-Lite" because the computer monitor casts an eerie glow about the room. 1984: Paul Swanson writes his own BBS hosting software for the ATARI 6502 8-bit computer. He names it "Nite-Lite". The Nite-Lite BBS hosting software goes on to be the most successful commercial BBS software ever written for the ATARI 6502 8-bit computer. 1989: Nite-Lite BBS puts in a second line. (MichTron boards eventually take the place of all of the ATARI Nite-Lite boards.)" - Winston Smith

This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSs that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o OASIS (the commercial version) / OASIS Jr. (the pd version)
Originally by Ralph Walden, then Leo Newman took it over, followed by Glenda Stocks/Z INNOVATORS, then Alf (Jeff Williams).

All machine language. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". An excellent message system, and a complex file system. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). OASIS IV performs networking.

Glenda Stocks writes at http://world.std.com/~snet/glenda.htm :
I purchased the source code rights to OASIS and began marketing the BBS software to Atari 8-bit enthusiasts around the world. I felt that I had the superior BBS software because I had programmed in the ability to run external programs, including online games and user surveys. I also had added color prompts for IBM clone users who called Atari boards running my OASIS software. Sometime in 1991...I sold the rights to OASIS to a man in Canada..

Jeff Williams ("Alf") writes: (12/6/02)
OASIS was around prior to either PRO or BBS Express IIRC. I don't know when exactly it showed up, version 3.09 was the first one I remember seeing. What made it nifty was it was very fast, being all assembler, and having some different features that things like Forem & Carina didn't have. Compared to something like Forem MPP at the time, it was kind of amazing.

Ralph Walden sold it to Glenda Stocks, who chopped it up into modules and sold it as ver 4.7. PRO was out by then, and was a much more complete offering imo. Glenda wrote some modules for 4.7, but it never really went anywhere because the architecture was so cramped with her changes.

Eventually she gave up and sold me the source. I looked it over and realized it was a mess and nothing was going to happen with it. I worked on a version 5 for a while, but never made much progress.

o SMART BBS -- by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

Subject: 10.3) How can I read/write 8-bit Atari disks on an MS-DOS PC?

There are several programs that allow an MS-DOS system to work with an Atari-format 5.25" diskette. Each of these work with the Atari SS/DD 180K format, so you'll need an Atari DOS and disk drive capable of this format.

#1 Choice:
AtariDsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

#2 Choice:
MyUTIL by Mark K Vallevand. Based on Charles Marslett's UTIL.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/myutil.zip

Includes SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Other similar utilities:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
www.umich.edu/~archive/atari/8bit/Unverified/Diskutils-redist/atario21.arc
SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/sr.arc
UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks.
http://www.wordmark.org/

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of thumb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of

course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above mentioned utilities work with SS/DD 180K Atari-format disks or
SS/DD 180K SpartaDOS disks, the following combination of utilities has been
used successfully to read SS/SD 90K Atari-format disks. So if you only have
standard Atari 810 and/or Atari 1050 drives, you could look into:

AnaDisk -- now a product of New Technoligies Inc. (NTI)
See: http://www.forensics-intl.com/anadisk.html
The current version is "not made available to the general public" (!)
Previously a product of Chuck Guzis @ Sydex, http://www.sydex.com/
Older versions available: http://ch.twi.tudelft.nl/~sidney/atari/
- Reads/Writes "any" 5.25" diskette

DeAna by Nate Monson
Available: http://ch.twi.tudelft.nl/~sidney/atari/
- converts AnaDisk dump files from Atari format

See http://ch.twi.tudelft.nl/~sidney/atari/ for tips on using this
combination of utilities.

Preston Crow writes:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 10.4) How can I read/write MS-DOS PC disks on my Atari?

Several 3rd-party hardware upgrades add the capability of working with
MS-DOS diskettes to your Atari system:

Happy 1050 upgrade for the Atari 1050
-- read/write 180K 5.25" MS-DOS floppies

CSS XF Single Drive Upgrade for the Atari XF551
-- replace the 5.25" mechanism with a 3.5" mech.
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade for the Atari XF551
-- add 3.5" drive without losing the 5.25" drive
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm

CSS Floppy Board, for the CSS Black Box
-- adds support for PC 720K and 1.44MB 3.5" drives to your Atari system
-- adds support for PC 1.2MB and 360K 5.25" drives to your Atari system
-- read/write 5.25" and 3.5" MS-DOS disks in your PC drives with your Atari
see: http://www.nleaudio.com/css/products/floppy.htm

Subject: 10.5) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two computers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not. I have
only used 'Procomm 2.4.3' (the last shareware version of
Procomm) on the PC and BobTerm on the Atari, but other
term programs may work.

To check your null modem connection, start both PC and
Atari term programs, set baud to 2400 or 4800 on both
computers. No parity, 8 data bits, 1 stop bit on the PC.
Be sure to use the correct COM port on the PC. Go to
'terminal' mode and you should now be able to type on
either computer and see it on the other screen. To
accomplish a file transfer, use Y-modem probably from
BobTerm, rather than X-modem. X-modem will often append
bytes to a file transfer, an undesirable event. There is
also a very nice Z-modem recieve program for the Atari,
called ATAR-Z-MODEM by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about
30 feet long, is to use two female DB25 connectors
(Radio Shack) some three or more conductor cable. Using
the two DB25 female connectors allows unplugging your

modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: Connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6

7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?

SIO2PC
======
From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:
- Emulates 1 to 4 Atari disk drives
- Store your Atari files on PC hard or floppy drives
- Boot from the PC, real drive not needed to start-up
- No software or drivers required for the Atari;
no conflicts: use your favorite DOS
- Twice as fast as an Atari 810 drive and more reliable
- Co-exists with real drives in the Atari daisy chain
- Compatible down to the hardware level: use sector copiers, etc.
- Print-Thru captures Atari print-out and routes to PC's printer
- Convert Atari files to PC files and vice versa
- 1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.geocities.com/atarimods/atari.html

Atari810
========

Atari810 1.4d, by Dan Vernon, is a disk drive emulator in the tradition of SIO2PC, for the Windows NT/2000/XP platform
http://retrobits.net/

Subject: 10.7) How can my Atari use my PC's HD, printer and modem using APE?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software.
The Atari Peripheral Emulator (APE for short):

- lets your PC act as high-speed drives.
- It lets you print to your PC printer.
- And it lets you use your PC modem on the 8-bit."

http://www.atarimax.com/

Subject: 10.8) How can I connect my 1050 to my PC with the APE ProSystem?

The APE ProSystem goes beyond APE. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a cable designed to allow direct connection of a stock 1050 disk drive directly to a PC's serial port for use by the PROSYS.EXE software.

http://www.atarimax.com/

Subject: 10.9) What about interoperating with the Apple Macintosh?

Mark L. Simonson keeps a nice set of web pages which he calls "Mac/Atari Fusion: Atari 8-bit Resources for Mac Users." Please visit:

http://www2.bitstream.net/~marksim/atarimac/

Subject: 10.10) Are there 8-bit Atari tools for the Commodore Amiga?

'551conv', freeware by Achim Hartel:
Converts a real Atari-800-disk, .xfd-image or .atr-image into a real Atari-800-disk, .xfd-image, .atr-image or extracts the files of the disk (-image). All 4 formats of the XF551-station supported: Single, Medium, Double, Quad. Version 1.03.

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong.

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari, Incorporated is formed by Nolan Bushnell, incorporated on Tuesday, June 27.

Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari, Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

1979
Atari files with the USPTO for a patent for a "Data processing system with programmable graphics generator" (the 400/800 computer system) on January 8, 1979. Inventors listed:
Mayer, Steven T. (Auburn, CA);
Miner, Jay G. (Sunnyvale, CA);
Neubauer, Douglas G. (Santa Clara, CA);
Decuir, Joseph C. (Mountain View, CA)

The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand-built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirement had been met.

The first "real" consumer units were shipped in Nov. of '79 and were 400s to Sears followed very shortly by 800s."

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
From Atari Connection magazine:
"At the National Computer Conference in Chicago on May 5, 1981 Atari announced that the 8K Atari 400 was being discontinued and that the price on the 16K version was being reduced to $399."

The USPTO grants U.S. Patent 4,296,476 to Atari on October 20, 1981 for the 400/800 computer system. Read the full text of the patent here: http://makeashorterlink.com/?M2561456

November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Atari is split 3 ways: 1) Atari Corp 2) Atari Games Corp 3) Luma Telecom

Warner Communications sells the Consumer Electronics and Home Computer divisions of the former Atari, Inc. to Tramel Technology on Monday, July 2.

Tramel Technology immediately forms Atari Corporation. Atari Corp. inherits Atari copyrights/trademarks/patents for use in the consumer electronics and personal computing markets.

{ Warner sells the AtariTel division of the former Atari, Inc. to Mitsubishi Electric, and the former AtariTel becomes Luma Telecom.

A complete line of "cutting-edge" telecommunications products had been under development at AtariTel since 1981, but no products had been

released under Atari, Inc.

However, the Atari Videophone was nearly completed, and the product eventually surfaced as the Mitsubishi Luma Video Phone, aka Luma-Phone, aka LumaPhone. "The Visual Telephone"

Mitsubishi has since shut down Luma (date unknown).
}
(
Warner also initially retains the arcade division of the former Atari, Inc., and renames it Atari Games Corporation. Soon thereafter, Atari Games is a private, independent entity, though Warner remains a major investor.

Atari Games Corp. inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market.

1987
Atari Games creates the Tengen label for the purpose of marketing games for home game systems (potentially competing directly with Atari Corp.)

1993
Atari Games is (re-)purchased by Time Warner.

1994
Time Warner consolidates Atari Games into Time Warner Interactive. Use of both the Atari Games and the Tengen brands are discontinued.

1996
On March 29, 1996 WMS Industries (Williams, Bally and Midway) completes its purchase of Time Warner Interactive. Upon the sale, Time Warner Interactive adopts the Atari Games name and logo, and Atari Games is made a division of Midway Games.

1998
In April of 1998 WMS spins off to shareholders its entire stake of Midway Games, making Midway Games essentially an independent entity. Atari Games remains a division of Midway Games.

1999
Atari Games releases San Francisco Rush 2049. This turns out to be the last coin-operated arcade game sporting the Atari Games name and logo.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms. The Midway Games West division lives on, developing games for home systems for Midway Games.

February 7, 2003: Midway Games shuts down their Midway Games West division.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (U.S.) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, in a "reverse merger," Atari Corp. purchased JTS, with the new parent company taking the JTS name while Atari was immediately designated a JTS subsidiary.

(JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.)

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which was a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro Interactive's games, including several re-makes of classic Atari titles, were marketed under the Atari Interactive name and logo. Atari Interactive was termed "a Hasbro Affiliate."

Games produced by "Atari" under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Missile Command,
Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro, renaming the subsidiary "Infogrames Interactive." The purchase included the Atari titles and intellectual properties (known at Hasbro as "Atari Interactive").

Between 2001 and 2003 Infogrames placed the Atari brand on some of its "premiere" gaming titles.

2003
Beginning May 7, 2003 Infogrames Entertainment adopts the Atari brand and registered trademark for all operations, effectively changing the name of the entire company to Atari.

Additionally, the Company's wholly-owned subsidiary, Infogrames Interactive, Inc., which develops many of the game derived from the Hasbro line of board

games, changes its name to Atari Interactive, Inc.

TODAY = http://www.atari.com/

Infogrames Entertainment
========================
Founded in 1983 by Bruno Bonnell and Christophe Sapet, Infogrames Entertainment SA today has more than 1,800 employees worldwide (approximately 60% in Europe and 40% in the U.S.). A publicly traded company, Infogrames Entertainment SA (Euronext: 5257) is one of the top five publishers of interactive entertainment software in the world and is widely regarded for developing and distributing quality games for the mass entertainment audience.

Infogrames SA comprises two main subsidiaries: 1) the U.S. based, publicly traded Atari, Inc. (Nasdaq: ATAR); and 2) Atari Europe, which represents the Company's original operations. Atari, Inc. includes the former GT Interactive; Atari, Inc. also manages Atari Interactive, Inc. (the former Hasbro Interactive) on behalf of its parent company.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

As my contribution to save immortal souls,I am the sin eater.
Box up ALL your Atari 8bit hardware and software and ship it prepaid
to me,and I will save your soul from eternal purgatory and
damnation!

Isn't that good of me?

Happy Halloween! :)

3674. Looking for my old 800XL & stuff

Newsgroup: comp.sys.atari.8bit
Date: 2004-10-27 19:09:05 UTC
From: Chuck <clm701@hotmail.com>
Message-ID: <10nvsck2lm7lo27@corp.supernews.com>
Source record: 14181

A few years back I finally sold my Atari 800XL, books, carts, 1050 drives, tape drive, 300 baud modem, Star SG10 9-pin printer, and tons of other stuff. Well the person I sold it to, sold it to another, and then later after a few phone calls I found out that this gentleman had sold it as well, and had long lost that person's name and so forth. Well I'd like to just see if perhaps maybe one of you may have ended up with my old machine.

Since I had engraved my 800XL, 1050 Drives, and tape drive I thought I would see where it may have ended up, and if it was still in mint condition, and in good hands.

I engraved everything with the letter "M" followed by the last 4-digits of my phone number at the time. If you have an Atari 800XL or 1050 drive, tape drive or 300 baud modem that is engraved like this, I was the original owner. I had purchased it at a Toys R US in Maryland, used it till I joined the AF in 1986, shipped it up here to Minot ND and still used it till I finally parted with it in 1996.

I would enjoy hearing if anybody has any of my old Atari stuff, and I hope it is good hands and still running.

Thanks
Chuck in Minot ND

3675. Question about demo tune

Newsgroup: comp.sys.atari.8bit

Source record: 14182

Hi,

I'm looking for information regarding the music running during the first sequence of the Atari Expo Demo 1991. Does anyone know who composed it? Does it have a name? Is there a MIDI (or other) file of it?

I also used this tune for my Tetris clone 'The Wall' (by copying the appropriate file from the demo disk and appending to the game, no hack required). So, if you think you might know but don't have access to that demo, you can also listen to the game.

Thanks,

-Itay

Great, now I have that song in my head (despite not playing Expo '91 demo
or Wall in a number of /years!/) :^)

> I also used this tune for my Tetris clone 'The Wall' (by copying the
> appropriate file from the demo disk and appending to the game, no hack
> required). So, if you think you might know but don't have access to that
> demo, you can also listen to the game.

The Wall, EXE version:
ftp://atari.fornax.sk/pub/atari/8bit/Games/Files/thewall.exe

The Wall, ATR version:
ftp://ftp.spudster.org/pub/atari/cth/games2/atr/t/thewall.zip

Atari Expo 1991 Demo, ATR version:
ftp://ftp.spudster.org//pub/atari/cth/games2/atr/a/atariexpo1991demo.zip

Atari Expo 1991 Demo, DCM version:
ftp://atari.fornax.sk/pub/atari/8bit/DEMOS/images/EXPO1991.DCM

Enjoy ;)

One clue that MIGHT help is the sequence in Expo'91 that plays the tune says:

SIMPLE DEMO
WRITTEN BY THE MISSING LINK

(hehe, kinda ironic, huh?)

That doesn't mean he/she wrote the tune. It could have just as easily been
ripped from a game. That was pretty common in early demos. (It seems
most of the great tune composers from the late 80s / early 90s were doing
games. These days, the demo groups have their own great tune composers,
so no ripping is required ;^))

That's not enough - there are another one or two demos on that disk that use the same tune, so even if Missing Link really did that demo (which is as simple as its name implies :) it doesn't mean they did the music.

Come on people.. Such a cool tune and no name or author?

Quite good ;-) For me, the most funny was Stickman. Nevertheless, the funniest thing was all those preparations, creations of effects and so on... We spend a lot of time together. This remind me the old "good" times, when the main (and only) duty was to answer the letter from an atari-friend, share the stuff via 5.25discs, go to a copy-party. Now, we have no time for it...

> PS - How long did it take you guys to produce that video!? Somehow, I think

About 4 month, but you should take a correction to the fact, that the video was created mainly during week-ends, because of work and other 'common' things... Anyway, it was really funny.

All the best

Ok, there are two demos on that disk with that music. The first has no reference to the music, the second has this text in the scroller:

nog bedankt jomaware, voor het startadres van de muziek van plastron, het scheelde een hoop zoekwerk.

Which, machine translated from Dutch, means:

Still jomaware thank, for the start address of the music of plastron, it made a difference a heap zoekwerk.

This sentence makes sense: To get the music running, all that has to be done is to load the music binary and jump to the entry address. The author is thanking someone (jomaware?) for making their life easier in finding out how to get the music to work. So again, the author of this demo is not the author of the music. "Jomaware" returns no results in google (I guess it does now, heh), time to figure out what plastron is (a band, I assume). Hmm.

Well, looks like I answered my own question. Plastron was an (unfortunately unsuccessful) game developed for a company named Harlequin in 1990. The game's background music is, lo and behold, exactly the tune also used in the 1991 Expo Demo and The Wall. Apparently this is the music's source.

Game credits are:
Plastron
Copyright 1990 Harlequin
Coding Andy Mills and Andy Dickinson
Graphics & Music by Richard Munns
Produced by A.R.A.

More info at: http://www.jetbootjack.com/JBJ_plastron.html

Hrm, okay, maybe I don't have a Rambo upgrade, but a Newell one, or
something. The banks are close, based on what I saw on the 'net.

I just tried running the demo in Atari800 with the "-rambo" option, and it
worked flawlessly. So, at the least, I can demo it in the emulator at VCF. :)

Just a comment. ABBUC has a dowload area, I'd guess the prize winners are
there. However, you must be a member (I guess) to access the download area.
Certainly a fair policy for the really great prizes and encouragement to
write A8 new stuff. I don't think ABBUC actually copyrights the prize
winners, and nobody seems to get the programs and put them someplace,....
well. shall I say?.....free.

Yes, that's correct. These programs were published on the last two
ABBUC disk magazines (IIRC no. 77 and no. 78).

> and nobody seems to get the programs and put them someplace,....
> well. shall I say?.....free.

I've uploaded the new version of MyPicoDos (a "gamedos" with support for
MyDOS subdirectories, 720-65535 sectors SD/DD disks/harddisks, high
speed SIO, optional long filenames, BIN/BAS/COM files, etc.) to my homepage

http://www.horus.com/~hias/atari/

MyPicoDos is GPL'ed and comes with full source code, an ATR-image with
the initializer program, and two directly bootable ATR images which are
useful for (peripheral-) emulator users.

so long,

Hias

...to the Commodore, Apple, Atari or Spectrum, feel free to do so:

http://www.geocities.com/dunric/westfront.html

(scroll down to "Golgatha II", near the middle of the page).

"Golgatha II: Demon World"
By: Paul Panks (dunric@yahoo.com)

Abstract:

Play an adventure/maze RPG game similar to Box Mania II on the classic Commodore 64 computer. Complete with redefined sprites, an in-game level editor and complex gameplay.

Pressing "p" will pause gameplay. During a pause, the gameplayer can also speed up or slow down the action in the game by pressing the "+" and "-" keys, respectively.

The in-game level editor allows editing of existing levels, or creation of entirely new levels. Levels can be as large as 20 x 20 in size. Since each character sprite is approximately 8 x 8 in size, this is equivalent to a 160 x 160 screen size dungeon.

Use the "S" coins to "Supercharge" (think: Pac-man). Once a coin is picked up, VAP can run into an Evil (either green, orange or red) and turn him blue (freeze him momentarily). Keep in mind, however, that in Golgatha II (as in pac-man) the evil will eventually "unfreeze" and we able to go after VAP again. This differs from Golgatha: The X-Chronicles, whereby freezing an Evil was permanent for that level.

"Atom Splitters" look like little stars, or an asterisk symbol. Touching them will cause VAP to lose at least one man, and possibly two. Such is the same if VAP walks over an "X" symbol, which is sometimes necessary (on some levels). Picking up the round, blue spheres will give a man back to VAP.

"Yellow Slime", or healing pools, are sometimes available on a dungeon level. This increases VAPs strength to maximum, so long as he is standing over it. Conversely, the "Red Pools" are like lava, and cause VAP to lose hearts, and a man, if all hearts are exhausted for that man.

"Green Slime" will also cause VAP to lose hearts. The "Oozer" monster can walk over the slime and move it around, forcing VAP to be very careful where he moves. VAP can also pick up the "Anti-Slime" containers, and remove slime from the dungeon floor.

Teleports (the purple "staircases") are a bit unwieldy, as they sometimes will move VAP into an area around the teleport (which may occasionally turn out to be a wall, in some instances). Just walk past it by moving into the next available dungeon floor space.

In 'Golgatha II', there are two tilesets the player can select from at game start. There is the new tileset, created especially for the sequel, with slightly upgraded level sprites, and the older sprite tileset (as in the original game).

I wrote the "Golgatha" series during a break between updates of "Westfront PC: The Trials of Guilder". I wanted to create a graphical game that was fun to play, could be ported to multiple platforms (such as Linux, Macintosh, Commodore 64/128, Atari 400/800, IBM PC/PC Jr., Apple II/IIe, Spectrum, etc.) and had interesting enough gameplay to make it a worthwhile maze/adventure game. I think I've succeeded in this matter, but that's ultimately up to the player to determine. =)

Sincerely,

Paul Allen Panks

Thanks to FCUG treasurer, Dick Estel, photos from the Classic Gaming Expo 2004 are now on-line! CGE 2004 was held on August 21-22 at the San Jose Convention Center in San Jose, California.

Go to http://www.dickestel.com/classicexpo2004.htm#bernardo

Have a gander at the vast CGE display museum, the 4Jays.com booth, Seth Sternberger and 8-Bit Weapon, TOGA president Randy Abel, Michael at the Cloanto booth, Atarians Bill Kendrick and Dan Kramer, the CommodoreOne running a C= game, Jeri Ellsworth, and more. My favorite photo -- Jeri's C64 birthday cake!

Truly,

I will be finishing JellyBeans... adding new music and some updated
screen graphics by Adam Powroznik soon. Actually the music and
screens are there, I just need to make the options screen (skill
level, Player neme etc...)

The in-game graphics have been updated from what I submitted to ABBUC
as well.

I will post more info here: http://geocities.com/vlastaar/jellybeans

JellyBeans won 7th.

LOL!

I don't think there is an alternative.

But the auction you cite is surely an exception - a silly price that must surely be a mistake because, as you say, those games can't be worth much more than $100 maximum. In any case that price is way beyond reasonable. Bloody hell, it's actually shocking.

Gareth.

3718. How to convert full-disk games to files?

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-01 00:12:47 UTC
From: The Wanderer <wandererstill@yahoo.com>
Message-ID: <1099267967.795556.194110@z14g2000cwz.googlegroups.com>
Source record: 14125

I'm curious about how to take a .ATR game image and turn it into a .EXE file that could then be put on a mega-image. For instance, to take the full-disk version of MULE and turn it into the 330-sector EXE version of MULE, which can then be combined with a lot of other games on a disk.

What utility do I need to do this? Many of the full-disk games I have are protected or have purposefully corrupted directories. I have access to a huge library of utilities, but I'm stymied to know which one can extract games from disks.

Also, while I'm asking questions - SpartaDOS X sounds like the best possible DOS for an 8-bit with a hard drive. Where can I get this on a cartridge, or can I somehow run the SpartaDOS cartridge image from disk?

Thanks.

It depends on the game. Most games that could be converted to .exe files
already have been. There is no utility to do it. A game like MULE is
probably too complex and big to make into an .exe. If you have copy
protected originals, you can make .PRO images using a PRO cable/interface.
You can't get a binary load SpartaX either, it too is too big and complex to
put into a file, uses a lot of bank switching. It may be possible to put
SpartaX on a maxflash cart, but I doubt it.
There may be a utility to convert some boot disk games to files, but not
most.

SpartaDOS X has already been put on a MaxFlash cartridge
(http://www.atarimax.com/flashcart/). The bank switching schemes were/are
very similiar so I guess it wasn't that difficult. No pass-through though.

3724. Best DOS for HDD system?

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-01 18:23:20 UTC
From: The Wanderer <wandererstill@yahoo.com>
Message-ID: <1099333400.041478.248490@c13g2000cwb.googlegroups.com>
Source record: 14131

This is somewhat related to my earlier question from yesterday: what's the best DOS for a system with a large (256 MB) HDD attached via an IDE interface? Ideally, I'd like a DOS that lets me create nested subdirectories, each containing hundreds of files. Batch file support would also be nice, though if I can write pseudo-batch files in Basic using XIO commands I'd consider that OK.

I see a lot of people using both MyDOS and SpartaDOS. Beyond the DOS 2 compatibility issue, what are the other pros and cons of these two DOSes against each other? Are there any other really good HDD DOSes I should be looking at?

SpartaDOS X doesn't seem to be an option, as I can't find a cart of it and you don't seem to be able to boot it from disk.

3725. Atari 8 bit boot cd (been there, done that)

Some carts (SpartaDOS X, R-Time 8 cart, the MUX Multiplexer carts) have a cartridge slot on top, so you can do this:

Atari <- RTime-8 <- SpartaX <- Action!

...for example. So you can use Action! on your Atari, but still have SpartaDOS X as your DOS, and have clock capabilities with the RT8.

Here's a photo I found via Google Images:

http://home.planet.nl/~lojek000/MyATARI/SDX_files/SpartaDOSXSetR80.jpg

Just imagine another cart plugged into the top (which is on the right of the pict, since it's lying on it side).

Pretty spiffy!

I like SpartaDos myself, but then I'm an old DOS command-line guy.
However, with the MyIDE inteface, unless you have burned a new OS rom, you
can't use SpartaDOS with it, since spartados uses ram under the OS to store
most of its routines.

Sparta is a command-line OS, while MyDOS is menu-driven like AtariDos. I
guess it depends on your preference.

There is a specialist games/computers/classics auction site which I
believe is US based. I can 't remember the URL but asking at Atari-Age
will no doubt turn it up. I think Curt (Atari-history) uses it.

3737. A Commodore (gasp!) adventure story! =)

Newsgroup: comp.sys.atari.8bit

This is a story of an adventure game I wrote on the Commodore.
Enjoy! =)

"A Commodore Adventure"
By: Paul Allen Panks (dunric@yahoo.com)

They say insight often comes from having dreams. Thanks to a dream I had recently, I can now recall with clarity what happened to my original version of "West Front to Apse" (henceforth, called 'Apse').

In my dream, I was shown exactly how I went about coding the game itself, as well as the general timeframe for the game's creation. I even saw specific lines of code as I LISTed the game on screen, a rarity for the often fractured nature of the mind's dreamscapes.

This was a game I spent 8 long months working on, but it was also an amalgamation of two distict adventure games (one of which I finished the previous summer, in 1993). It was written in the 128 mode of the Commodore 128 (in BASIC 7.0). The game included an attractive sprite title ("WESTFRONT") overhanging a scrolling, WINDOWed text display. I also made use of function keys for the most frequently used commands (such as "GO NORTH", "INVENTORY", "MAP", etc). Because of the sprite display, I ran the game in 40 column mode.

To top things off, I included both short and long range displays of the gaming environment (viewable via the MAP command). The long range display showed a 3-dimensional, hyperbolic sprite of the mountainside (shaded in blue), with a bright dot showing the current player location (the dot would flash on and off slowly).

The short range display, conversely, would show (depending on which room the player was in) an interior view of the tavern, shop, church, etc. I only made this map for the first few rooms (due to space limitations). The graphics were incorporated into the program listing (206 blocks long, with a 74 block sequential data file).

The room descriptions were quite varied and very elaborate. I wanted to fill at least 320 characters (8 screen lines) with each individual room description. Some room descriptions were as large as two screens! Because of the enormous size of such descriptions, it became necessary to move most of them into a 74 block SEQuential file called "WESTDATA". The commas had to be left out, of course.

Influencing my decision to write Apse was the online MUD called "LustyMUD" (despite the name, it was/is a family-oriented Multi-User Dungeon game). The beauty of LustyMUD lay in the intricate and often

detailed room descriptions, and of course, the exceptional monsters, items, armor and quests. Player interaction was also a key element, but that was not transferable to an ordinary text adventure.

The game took place in Norway (don't ask me why; I flipped open a random World Book Encyclopedia and Norway was the most interesting place I found). I made sure to include descriptions of Oslo, Stavanger, Bergen, Trondheim and other towns. Even Flora Island was incorporated into the gameplay (the player had to travel by boat to Flora Island, where an old lighthouse could be explored at length).

My imagination was not limited to my own mind, however, and so I turned to popular culture to help fill in the blanks. A common joke at that time was to always include a Smurf Village into a new text adventure, so that the game had an element of dry humor. I included the bare essentials: a few mushroom houses, Papa Smurf, Jokey Smurf, Brainy Smurf, Smurf forest, Handy Smurf, Gargamel's castle, Gargamel and Asriel (Gargamel's cat). In Gargamel's castle, I placed a lump of gold, a beaker (for mixing potions), a spellbook and a few miscellaneous items.

But Gargamel seemed too wimpy an end boss, so I turned to Will Wright's "The Immortal" for help. My brother played this wonderful 3/4th perspective adventure game on his NES, and the help booklet was lying conveniently around. I leafed through that until I found the entry "Mordimar", an evil magician. He seemed devious enough for my tastes, and so I constructed a four room castle near Bergen, complete with a golden throne and a flowing fountain in the castle courtyard. I also included Gomar, a wise troll, into the game (placing him up in a tree). Apparently, Mordimar had taken the "life force" (Chi) out of the forest and only Gomar, the wise Troll, knew how to bring it back to the woodland creatures (hey, I'm not making this one up).

In all, I had roughly 8,000 bytes free upon reaching the 200+ block mark in BASIC 7.0. Variables, as you probably know, are stored in Bank 1 in Commodore 128 BASIC (Bank 0 contains the program itself). Thusly, I had over 120 KB to work with in molding my game into the contrived mess it became.

For a parser, I borrowed heavily from the October 1984 issue of Compute!'s Gazette. The Gazette ran a feature article entitled "Teaching your computer English". It was a simple text adventure, but the parser was easily understood. I had never written a parser before, and so I incorporated a modified version into Apse. This led to the interesting "feature" of being able to type "GO NO" for "GO NORTH", "IN" for "INVENTORY" and "GE LA" FOR "GET LANTERN" (among other examples). My cousin Tim, who helped bug test the game, enjoyed this shortcut immensely:

Tim: (issues a GO NORTH command) "Ok, I just moved north..."
Paul: "You can use abbreviations, you know..."
Tim: "Really? Coooollll...."

Paul: "Try typing: GO NO instead of GO NORTH."
Tim: "Ok...Oh, neat! I like that feature!"
Tim: "Can I pick up the tree?"
Paul: "No."
Tim: (issues a GET TREE command in the forest) "It says 'Ok.' "
Paul: "Huh?"
Paul: "Check your inventory..."
Tim: (INVENTORY command reveals that he now has the TWO-HANDED SWORD)
"What the heck?"
Paul: "Wait a minute!..."

My other cousin, Ryan, also beta-tested Apse. I remember (quite vividly) the look of puzzlement on his face the very first time he played my game:

Ryan: "Why can't I examine anything?"
Paul: "Oh, you just examine _objects_ in the game..."
Ryan: "Oh, ok...hey, what's the wine for?"
Paul: "You drink it..."
Ryan: (drinks wine)..."Ok...I'm now in Smurf Village. How the hell did _that_ happen?"
Paul: "Keep playing, it gets better..."

Indeed it did get better, but only if the player exploited the bugs therein. You see, this game had many, many errors. For example, you could sell items to the Bergen shop (which I modeled after the online version) even if the items themselves had no value whatsoever. I remember setting a price of "0" for the scroll, but that could be sold (and purchased) for "0 gold coins". Doesn't make sense, does it?

The WIELD command was also buggy. In practice, the player should have been able to wield only one weapon at a time (especially the "TWO-HANDED SWORD"). But in some cases, the player could be wielding the "SCIMITAR" while he/she also was wielding the "DAGGER". Also perplexing was the inclusion of a "WINESKIN" (a kind of primitive water container). It could only hold water, but not wine. The "WINE BOTTLE" itself could only contain wine (never water).

And you couldn't pick up the wine bottle and drink it. You had to drink it from the tavern table for any useful effect. Drinking the wine sent the player to Smurf Village, while reading the spellbook (inside Gargamel's castle) sent him back to the Bergen Church.

One other "feature" I will always remember about this game: the sprite data would occasionally overwrite small portions of the game itself. I inadvertently BLOADed the sprite data for either the title or exterior surface map into locations 3584 through 4096. Since the beginning of BASIC 7.0 on the Commodore 128 was at location 4096, the first few lines of the game became corrupted.

But since the sprite data was always the same, every time I ran the game twice I received an error in Line 0. Fixing a few random

characters back to their original value fixed this error. A quick view of the BASIC 7.0 Reference Guide would have revealed that sprites ended at location 4095 (and not 4096), but I added 512 bytes to 3584 (instead of beginning my count at location 3583). Thus, I counted "3585" as byte 1, "3586" as byte 2, "3587" as byte 3, etc., instead of designating location 3584 as my first sprite byte (a block of 8 sprite shape definitions occupies 63 bytes per sprite data block; thus, 512 bytes/64-1 = 8 sprite shapes).

I began coding the first version of this game in May, June and July of 1993. I set aside that original adventure (originally written for the Commodore 64), and went back to school at Chaparral High in Scottsdale. I completed my Junior year in June of 1994, but while there watched a film entitled "All Quiet on the Western Front". Although this movie had not one iota of similarity between a traditional text adventure game and what it discussed, I nevertheless chose "Westfront" as my lead title for my new adventure game.

So how did "Apse" get added to the title "Westfront"? I was flipping through, yet again, a World Book Encyclopedia and read about the Christian Catacombs of Rome. One of the references discussed the origins of the catholic church. I learned how old catholic churches often had "Apses". An Apse is essentially a vaulted or domed recess of a church, sometimes at the end of it (at times, towards the eastern portion). The nave in the apse usually extended past the pews, occasionally reaching the altar itself. This all sounded very cool, but I wanted to reverse the standard eastern end to be "western". Thusly, I included the term "Apse" into the full name of the title.

Beginning in mid-1994 (perhaps around May or June), I loaded up the old version of "Westfront" and decided it needed a serious makeover. Between May of 1994 and February of 1995, I worked on coding "Westfront to Apse".

I spent countless hours at the keyboard, hammering away. I drew inspiration from everything: movies, books (including TSR Hobbies "Dungeons & Dragons"), television, magazines and even dreams. While working on Apse, I took it easy on my Senior-level classes. I even casually mentioned the game while playing paper football with my future fiancee in art class. We drew unflattering pictures of the student teacher, which the regular art teacher discovered (and lectured me about), but that was another story.

By mid-February 1995, I completed the final stages of Apse to my satisfaction. The result was a game encompassing over 80 rooms and 80 nouns. I think I limited Verbs to about 30 or 31. Overall, with the data and everything else, I had about 8,000 bytes of BASIC memory left after I hit the 200 Block mark. I was most proud of this game, even at one point asking the folks at comp.sys.cbm if they'd like a copy of it. I don't recall anyone ever showing interest, but that was in 1996, after all.

For a few years after completion, I set the game aside, almost losing memory of it. Then one day, in early 1997, I pulled it out and played around with it. I was ashamed of all the bugs in it, so I formatted over the original disk (knowing I had a backup copy of it) and wrote "Westfront II" to be less error prone and more like online MUDs. "Westfront II" was also written for the Commodore 128 (but this time in 80-column mode), and eventually included over 350+ rooms and 80+ nouns. I stored all of the program data in SEQ data files on disk.

"Westfront II" eventually became my popular text adventure "Westfront PC: The Trials of Guilder" on the Windows platform. That game, for trivia purposes, took 7 years to fully debug and complete. Thanks to the 32-bit architecture of Microsoft Windows (and PowerBASIC's Console Compiler), I was able to expand the game to 1,728 rooms and 4 continents. The game itself included over 200+ nouns, items, monsters, and other objects. I also included a staggering 50+ quests, as well as several dozen side quests and parlor games.

A few years ago (in 2002), I pulled out the old backup copy of Apse and loaded it up. Unfortunately, although I had the habit of saving two copies of the game to each disk (named "WESTFRONT" and "BACKUP", respectively), both programs stopped abruptly about 190 blocks in with "?DISK READ ERROR"s (meaning that both files were hopelessly corrupted).

LISTing either version of the game displayed approximately 3/4ths of the BASIC program listing, which was then followed by an endless stream of gibberish. Running the program halted it halfway through the initialization process, where an "?OUT OF DATA ERROR" would unfortunately occur (since the end of the program was DATA statements, the scrambled portion of the DATA forced the out of data error).

I tried saving both files to another disk, but they too wouldn't save properly. In frustration, I formatted over the disk and wondered if I mad additional copies of the game lying around. The only versions I found were, tragically, from late 1994 and did not include Mordimar, Norway or some of the other objects or areas that made the completed version so much fun. I eventually recoded the game in late 2003 from the remnants of the last existing version (approximately 153 blocks long). Thus, I was forced to recode nearly 35% of the game from scratch (e.g. from memory).

Once I completed the new version of Apse, I placed it up on the web for others to download and enjoy (I made a point to remove all of Smurf Village and replaced it with a "Golden Elf village", for copyright reasons; everything else remained the same). But the game wasn't an exact copy of the original, because some of the room descriptions also had to be rewritten from memory (as did the sprite definition of the title "WESTFRONT"). Although the sprite title of "WESTFRONT" had to be redrawn, the exterior surface map sprite was (thankfully) still preserved on a separate programming disk. I

included that into the new edition of Apse.

After much research, I determined that the dreaded Save-With-Replace bug was to blame for both files being corrupted (and thusly, overwritten). It was a long held practice of this programmer to type the command 'SAVE"@0:[program name]",8' at the end of each programming session. After eight months of saving the same program over and over again, you can quite imagine the errors this produced on disk.

The final chapter in the "Westfront to Apse" story has yet to be written. Currently, three of my programming disks believed to contain traces of the original, completed game have been sent to the ActionFront Data Recovery labs in Santa Clara, California. I also included a 1571 disk drive manual along with the diskettes (in order to better explain the unusual GCR format -- Group Code Recording -- of most Commodore formatted diskettes). Although I am not confident of full data recovery, I am hopeful that at least some remants of data are recoverable by ActionFront.

Sincerely,

Paul Allen Panks

> 800/xl/xe game released?

No, it is not limited to 100mb. It should also be possible to create
a DVD with 4.7GB of Atari stuff - if you are able to find so many
ATR images :-)

At the ABBUC meeting we showed a CD with some 1300 images on it
which was approx. 300MB big.

Note: single density images use twice the space on CD as they use
on harddisk because the BlackBox only uses 128 bytes of a 256 byte
sector. So the CDs tend to get full pretty quick - but it should
still be no problem to build an "all and everything for the Atari
8bit" CD :-)

so long,

Hias

It's the DOS that won't address anything over ~8 drives and 16 megs per drive. If someone wanted to roll a new DOS there is nothing other then backwards compatibility to keep them from using 24 bit pointers and going up by a factor of 256x.

OK. I see pass-through. Now, I looked at atarimax and didn't find an image
for SpartaDOSX. Is it there, or where is it? I looked in the discussion
group, there were a number of images, but I didn't see SpX. I guess the
important thing is that it is possible to maxflash SpX, not that it is
actually available.
I have the ROM dumps of SpX, but I think I dumped my 4.19 if I remember.
I think 4.22 is the last ROM.
Actually, I don't especially like SpX, prefer 3.2g. I get disk errors with
SpX, it is too fast for my old drives, I guess. SpX has built in hard drive
directory builds. I don't remember, it has been a long time since I hooked
up my 20 meg hard drives, with MIO and Adaptec SCSI to MFM adapter.
I play Atari fairly often, still, but mostly Sargon III (an example of
making a boot disk into a file, I did this myself, I also hacked so Sargon
III would look for the opening book on drive 2, no disk swapping. I play
using XLIT.
But I ramble.

This is probably a dumb question which the answer is right in front of my eyes...butttt here it goes, any help is much appreciated

And yes ive read all the help files in windows, and chances are yes the one you were going to suggest..lol but anyhow...when i go to right click on the program .exe (eg. im trying to do it for msn messenger), i click properties, but then i dont see "Click the Program tab for an MS-DOS program or the Shortcut tab for a Windows program". How do i go about creating the shortcut key of my choice for msn messenger...the only tabs that appear when i right click the .exe and go to properties is: general, version, compatibility and summary. Please help me out, thanks

Dan

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

http://www.atarimax.com/flashcart/forum/viewtopic.php?t=32

It's in the FlashCart Discussion forum. It's SpartaDOS 4.22 that has been
turned into a flashable cartridge.

3753. TCPSER 1.0rc8 Available

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-03 09:08:09 UTC
From: Jim Brain <brain@jbrain.com>
Message-ID: <Zd1id.359287$D%.20072@attbi_s51>
Source record: 14010
Cross-posted to: comp.sys.atari.8bit,comp.sys.acorn

Followups set to comp.sys.cbm

TCPSER is a utility that turns a PC/workstation Serial port into an
emulated Hayes(tm) compatible modem, with the phone connection replaced
by TCP/IP.

Both inbound and outbound "calls" are supported, and the EIA232 DCD
signal is properly emulated to allow TCPSER's use with Bulletin Board
Systems.

The utility runs under Windows (via cygwin) or *NIX (source is POSIX C,
and might be portable to other systems with a reasonable POSIX
subsystem, though I make no guarantees).

A short list of features:
o One instance can support multiple serial ports.
o Each serial port is bridged to the same TCP/IP listen port. This
allows a single TCP/IP port to be routed to the first available "modem"
port, which is very useful for multi-line BBS support
o Different text files can be sent for connect, answer, busy, and/or
no-answer conditions. files can differ between local and remote connections
o Support for almost all Hayes normal and extended commands.
Proprietary commands fail fail gracefully, enabling existing init
strings to be used without errors
o As of rc8, direct connect operation is supported (for games that
required the phone connection to be present when the modems went off-hook)
o Properly emulates Hayes commands interpreter
a/ executes last command
you can turn responses on or off, text or numeric
atdt without a number takes phone off-hook
atdl dials last number
ath1 takes modem off-hook
etc.
o Rudimentary support for phone book. Also called aliasing, this can be
used to simply map longhostname.com to 555-1212, or it can be used to
icrcumvent older modem applications that only allow numeric data entry:
5551212 -> machine.host.com
o Understands and interprets Telnet NVT commands. Thus, this program
can be used to "dial" a telnet service. (Though, you need to set your
TERMinal after logging in)
o When not connected to a telnet service, TCPSER is 8-bit clean, meaning
it can successfully be used to transfer files across the Internet.

TCPSER is being used by a number of folks to bring up vintage "telnet"
BBS systems on older 8-bit computing platforms. Others are using it as

a low-cost way to put older computing systems on the Internet.

I encourage folks to try TCPSER and put your vintage/retro computing platform online. Existing users, I encourage you to upgrade to RC8 as soon as possible.

For those interested in more information on bringing a "retro" BBS up on the Internet, please visit www.telbbs.com

TCPSER is available at http://www.jbrain.com/pub/linux/serial/ and is released under the GPL.

Jim Brain

Note:

Existing null-modem cables can be used with TCPSER, though TCPSER uses the DTR line on the PC/workstation to emulate the DCD modem signal. Null modem cables normally tie DCD and DSR together. If proper DCD support is required and DSR must be high on the target platform, a small cable modification that disconnects DSR from DCD and bridges to DTR may be required. On target systems that float DSR high, simply pulling the DSR pin on the null modem cable end that attaches to the target computer will suffice.

Hi Dan,
If you have a shortcut icon on the desktop then right click the icon and from menu select the properties option and then on the shortcut tab you will have the option to select a shortcut key.. tab or single click the shortcut key box and the with keyboard type CONTROL KEY+ALT KEY+[any other key of your choice] and this will be your keyboard shortcut.. This is very easy to do just not often done. Regular .EXE files do not have this option..

OK, I found the flash image on atarimax for SpX 4.22. It is the first time
I've tried to burn an image. I boot from the image, using APE DOS 1.18,
registered, the burn screen comes up, I say burn, it erases OK, but I get an
error with the actual burn, it says error at verify.
The cart had Disk Wizard II on it, so I did the boot without the cart,
inserted the cart and tried. I tried several times. Is, maybe, the image
bad, or can someone give me some tips on what I might be doing wrong?
Thanx
Russg

I have tried about six different cartridges, all with no luck. The TV
is just a standard old TV which runs my 2600 just fine. I have tried
channels 2, 3, and 4. I still get no sound and no picture. When the
400 is on, the screen simply goes black and sound cuts off.

If you use the soft-os of MyIDE you can not use spartados indeed.

But you can try BEWEDOS. That dos does not use ram under os. Btw. BEWEDOS
is a very cool alternative for SpartaDos.

Message-ID: <418A80D1.485E0246@students.uni-mainz.de>
Source record: 14022

Well,
you know ABBUC is a club that has a disk magazine. So all programs of
the software contest can be found on the latest ABBUC magazines 76 and
77 (or 77 + 78?). To get these magazines one can simply become a member
of ABBUC or try to get them at ebay. Members of ABBUC can also freely
download all (older) ABBUC magazines...

But, as of yet there is no homepage where one can download the programs
from the ABBUC contest. Thats because a) ABBUC club members have to pay
for the magazines (so why should other Atarians get them for free?) and
b) ABBUC did NOT! get the copyright of these programs, meaning the
authors are allowed to upload (or give away) their programs anywhere
after the contest... maybe we will create such a homepage in the
future, but I guess that some ABBUC members would complain about
that... -andreas.

3767. Re: Help identifying Atari XL demo - Stick figure karate

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-04 19:35:30 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <418A8482.C5DA65F6@students.uni-mainz.de>
Source record: 14024

Well,
here comes the next guess: original Rambo and Newell upgrades did have
256k RAM, but since 64k were to be used as base RAM, only 192k
eXtended-RAM were available then. In the emulators, Newell and Rambo are
treated as if they have 256k XRAM (meaning a total of 320kbytes), which
is not true for (most of) the original / true Rambo and Newell RAM
upgrades.

So, I guess you simply do not have enough XRAM to run the demo on a real
Atari.
Meaning: the demo requires a total of 320kbytes RAM, but you only have
256kbytes RAM available (due to a bug of these Newell/Rambo/...
upgrades, some banks of the 64k base RAM can still be used as RAMdisk or
XRAM, but obviously this does not work with PIT demo)... -Andreas.

P.s:: You can test your extended Atari with XRAM 0.18, 0.19 or 0.21 by
satantronic; or with EXTDRAM.COM by Lee Barnes, or with other XRAM /
Ramdisk test programs. These programs should show your available
rambanks as well as the total memory...

Yep,
ABBUC does not get the copyright of the programs from the software
contest. So the authors (including you Russ !) are allowed to upload or
give away their programs after the contest. You can do this with your
dice game from the software contest 2003...

Or someone who isn`t a member of ABBUC could create a homepage and ask
the authors (of the software contest programs) to place their programs
there. If ABBUC itself would do that, I am quite sure that many members
would complain, since they have to pay for the ABBUC magazines (and for
being a member of the club). But as said before, after the contest is
over, the authors are allowed to upload or give away their
programs... -Andreas.

Well,
try the homepage of Satantronic (silly name, but nice Atari guys!), they
have schematics for a 1 Megabyte XL/XE ramdisk there, based on PC
SIMMs... -andreas

Hmmm,
is this a serious subject ?!? I mean other than cleaning the atari
equipment from dust, avoiding short circuits, avoiding the non-loading
of (aged) 5,25" disks, the color-changing of Atari equipment due to
smoking, prevent it from being stolen, prevent it from being thrown
away, etc. - what else could one do ?!? -Andreas.

Yeah,
in my eyes it should have won a much better place, but I still haven`t
figured out how to use the multiplayer option. Does one really need to
use two Ataris, two modems, a floppy and a telephone line (connected
between the two modems) to play the game in a network ?!? Well, my
null-modem cables did not seem to work.

Besides, the game seems only to work under Sparta-DOS format, with DOS 2
derivatives (like DOS 2.0, DOS 2.5, Bibo-DOS, Turbo-DOS, My-DOS, etc.)
it does not work - one has to use a Gamedos here (which then means that
modem support is not possible)... -Andreas.

Hmmm,
I would guess Sparta DOS 3.2x, Sparta DOS 3.3x, Sparta DOs X cartridge,
MyDOS 4.5x or Top DOS Professionel (if you find that anywhere) should
work quite well with a HDD... MyDOS and Top DOS use the DOS 2.x format,
whereas Sparta uses its own format... -andreas.

3775. Ramdisk Overview...

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-04 21:30:24 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <418A9F70.A47DEDD5@students.uni-mainz.de>
Source record: 14033

```
Hello folks,
here is a little Atari 8Bit Ramdisk / extra Ram overview (still
incomplete) and some examples what programs support or require Ramdisks
/ extra Ram:

------------------------------------------------------------------------

Subject 8.10: Atari 800/XL/XE extra RAM / Ramdisk Overview:
(Version 3.3 from November 2004 by A.M.)

A) Atari 400/800 Ramdisks:

- Size: 64k XRAM (+ 32k RAM)
Banks: 0 thru 3 (total memory = 96k RAM)
Types: Axlon (=Atari) and compatibles;

- Size: 128k XRAM (+ 32k RAM)
Banks: 0 thru 7 (total memory = 160k RAM)
Types: Axlon (= Atari) and compatibles;

- Size: 256k XRAM (+ 32k RAM)
Banks: 0 thru 15 (total memory = 288k RAM)
Types: D. Byrd and other selfmade / Axlon-compatible RDs;

- Size: 512k XRAM (+ 32k RAM)
Banks: 0 thru 31 (total memory = 544k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 1024k XRAM (+ 32k RAM)
Banks: 0 thru 63 (total memory = 1056k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 2048k XRAM (+ 32k RAM)
Banks: 0 thru 127 (total memory = 2080k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

- Size: 4096k XRAM (+32k RAM)
Banks: 0 thru 255 (total memory = 4128k RAM)
Types: selfmade / Axlon-compatible Ramdisks;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

B) XL/XE - 64k base RAM plus XRAM:
```

- Size: 64k (total = 128k RAM, 4 banks)
- Banks: E3, E7, EB, EF (block E = 1 block * 4 banks)
- Types: 130XE-Ramdisk, Turbo-Freezer-XL + 64k, selfmade-ramdisks...

- Size: 128k (total = 192k RAM, 8 banks)
- Banks: A3,A7,AB,AF,E3,E7,EB,EF
(blocks AE = 2 blocks * 4 banks)
- Types: Compyshop 600XL with 192k, Turbo-Freezer-XL + 128k,
selfmade-RDs...

- Size: 256k / 26AE (total = 320k RAM, 16 banks)
- Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF
(blocks 26AE, = 4 blocks * 4 banks)
- Types: Compyshop 800XL RD., Compyshop 130XE RD.,
Peters/David Megaram 1, Peters/David Megaram 2,
Peters/David Megaram 3 with 256k, selfmade RDs...

- Size: 256k / 8ACE (total = 320k RAM, 16 banks)
- Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF
(blocks 8ACE = 4 blocks * 4 banks)
- Types: Newell, Rambo-XL, Scott Peterson, Atari Magazin,
TOMS, selfmade-RDs...

- Size: 512k / 26AE (total = 576k RAM, 32 banks)
- Banks: 21,23,25,27,29,2B,2D,2F,61,63,65,67,69,6B,6D,6F,
A1,A3,A5,A7,A9,AB,AD,AF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 26AE = 4 blocks * 8 banks)
- Types: none (that I know of) at the moment - but possible!

- Size: 512k / 8ACE (total = 576k RAM, 32 banks)
- Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 8ACE = 4 blocks * 8 banks)
- Types: Scott Peterson, TOMS, selfmade-RDs...

- Size: 512k / 02468ACE (total = 576k RAM, 32 banks)
- Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
(blocks 02468ACE = 8 blocks * 4 banks)
- Types: 1) upgrade / combination of 26AE and 8ACE ramdisk
types to 512k RAM or to *one* 02468ACE ramdisk;
idea by me, built by Bernhard Pahl (see his homepage
at http://www.b-pahl.de/atari8bit/ramdisk)
2) Upgrade of the Rambo XL to 512k by Dan Schmid
(see Pooldisk Too, Subdir ACE/ Acec202a.ATR and
Acec202b.ATR) and of course 3) selfmade ramdisks...

- Size: 1024k / 02468ACE (total = 1088k RAM, 64 banks)
- Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
(blocks 02468ACE = 8 blocks * 8 banks)

- Types: Newell, Scott Peterson, TOMS, Satantronic`s 1MB-
PC-SIMM-RD, selfmade-RDs...

- Size: 1024k / 26AE (total = 1088k RAM, 64 banks)
- Banks: EF,EE,ED,EC,EB,EA,E9,E8,E7,E6,E5,E4,E3,E2,E1,E0
AF,AE,AD,AC,AB,AA,A9,A8,A7,A6,A5,A4,A3,A2,A1,A0
6F,6E,6D,6C,6B,6A,69,68,67,66,65,64,63,62,61,60
2F,2E,2D,2C,2B,2A,29,28,27,26,25,24,23,22,21,20
(blocks 26AE = 4 blocks * 16 banks)
- Types: Mathy van Nisselroy`s 1024k XEGS-PC-SIMM-Upgrade!
(with some changes probably also usable for XL and XE,
see also: http://www.mathy-van-nisselroy.nl)

- Size: 1024k / 8ACE (total = 1088k RAM, 64 banks)
- Banks: EF,EE,ED,EC,EB,EA,E9,E8,E7,E6,E5,E4,E3,E2,E1,E0
CF,CE,CD,CC,CB,CA,C9,C8,C7,C6,C5,C4,C3,C2,C1,C0
AF,AE,AD,AC,AB,AA,A9,A8,A7,A6,A5,A4,A3,A2,A1,A0
8F,8E,8D,8C,8B,8A,89,88,87,86,85,84,83,88,81,80
(blocks 8ACE = 4 blocks * 16 banks)
- Types: none (that I know of) at the moment - but possible!

- Size: 1024k / 0123456789ABCDE (total = 1088k RAM, 64 banks)
- Banks: blocks 0123456789ABCDE each with 4 banks
= 16 blocks * 4 banks (does not make much sense, but...)
- Types: luckily, none at the moment...

- Size: 1024k / ??? (max. memory = 1088k, 64 banks)
- Port-Bits / Control-Bits: $D301 = 2,3,6,7
$D600 = 0,1 (or switches);
- Banks: $D301: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF
$D600: F3,F7,FB,FF...
- Types: David/Peters Megaram 3 with 1024k RAM (and the switches
positioned to 1 x 1024k)

- Size: 2048k / 02468ACE (total = 2112k, 128 banks)
- Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F

- Types: Newell, FTE, selfmade-Ramdisks...

Well, I will not go into details with the disadvantages and
software-problems with ramdisks beyond 512k RAM (Selftest, XL/XE Basic,
RAM under the OS, separate Antic access, etc.). These problems mostly
occur with 1 Megabyte or bigger ramdisks and there are several hardware
and software solutions for them, alas not working correct with every
software or program. With 4 Megabyte extra RAM / Ramdisk, the PIA is
fully used/adressed, so that normally the base RAM at 4000-7FFF is not
available any longer. But again, there are tricks and solutions to
solve
this problem. Installing a second PIA for example makes it possible to
adress up to 256 Megabytes of extra RAM / Ramdisk - but who needs so
much
RAM on the Atari 8Bit computer ???

C) XL/XE - XRAM minus 64k Base-RAM:

- Size: 192k / 8AE (total = 256k RAM, usable = 12 banks)
- Banks: 83,87,8B,8F,A3,A7,AB,AF,E3,E7,EB,EF
(8AE = 3 blocks * 4 banks)
- Types: older Newell ramdisks (replace 64k by 256k);

- Size: 192k / ACE (total = 256k RAM, usable = 12 banks)
- Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF
(ACE = 3 blocks * 4 banks)
- Types: newer Newell RDs, newer Buchholz-RDs, Rambo-XL,
selfmade Ramdisks (replace 64k by 256k)...

- Size: 448k / 2468ACE (total = 512k, usable = 28 banks)
- Banks: EF,EB,E7,E3,CF,CB,C7,C3,AF,AB,A7,A3,8F,8B,87,83
6F,6B,67,63,4F,4B,47,43,2F,2B,27,23
(2468ACE = 7 blocks * 4 banks)
- Types: selfmade-RDs (replace 64k by 512k)...

- Size: 896k? / 0248ACE (total = 1024k, usable = 56 banks)
- Banks: EF,ED,EB,E9,E7,E5,E3,E1,CF,CD,CB,C9,C7,C5,C3,C1,
AF,AD,AB,A9,A7,A5,A3,A1,8F,8D,8B,89,87,85,83,81,
4F,4D,4B,49,47,45,43,41,2F,2D,2B,29,27,25,23,21,
0F,0D,0B,09,07,05,03,01 (0248ACE = 7 blocks * 8 banks)
- Types: Bob Woolley`s 1200XL 1MB Upgrade, selfmade-RDs
(replace 64k by 1024k)...

Allthough these RAM upgrades are relatively easy to build
(and to install into the computer), they make problems with
quite some software. Some programs tend to use the base RAM
as extra RAM / Ramdisk with these upgrades, which will most
often result in a crash of the computer. Next, most extra RAM
testers will show more extra RAM (or a bigger Ramdisk) than
there is really available (e.g. with a 256k upgrade you will
see 240k extra RAM, but there is only 64k base RAM + 192k
extra RAM). Alas, this is a typical hardware problem for these
upgrades and it cannot be solved or avoided with software...

D) XL/XE: Parallel-Bus-Devices:
(600XL/800XL = Parallel Bus, XE = Cart.-Port + ECI)

- Size: 128k / AE (total = 192k RAM, 8 banks)
- Banks: A3,A7,AB,AF,E3,E7,EB,EF (blocks AE = 2 blocks * 4 banks)
- Types: Turbo-Freezer-XL by Bernhard Engl with 128k XRAM

- Size: 256k / 9ABE (total = 320k RAM, 16 banks)
- Banks: 93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF,E3,E7,EB,EF
(blocks 9ABE = 4 blocks * 4 banks)
- Types: Turbo-Freezer-XL by Bernhard Engl with 256k XRAM

- Size: 256k / ??? (total = 320k RAM, 16 banks)
- Banks: unknown !!
- Types: Yorky-XL by Richard Gore / Derek Fern (from
GB/UK) with 256k XRAM

- Size: 256k / ??? (total = 320k RAM, 16 banks)
- Banks: unknown !!
- Types: Multi-Input-Output-Harddisk-Interface (MIO) with 256k
XRAM by ICD

- Size: 1024k / ??? (total = 1088k RAM, 64 banks)
- Banks: unknown !!
- Types: Multi-Input-Output-Harddisk-Interface (MIO) with 1024k
XRAM by ICD

E) XL/XE: RAM/Flash-ROM/... Cartridges:

- Rambox II with 256k RAM by JRC (Czech Republic; with special
Ramdisk drivers for TT-DOS and Bewe-DOS!)
- Ramcart 128k by ??? (Poland or Czech Republic)
- Ramcart 256k by ??? (Poland or Czech Republic)
(for some hints and pics see: www2.asw.cz/~kubecj/acarts.htm)
- Flash-ROM cart. 512k by Stefan Dorndorf (Never released! But I do own
a non-functional prototype-pcb; it should have used 64k for the OS
and the remaining 448k as user-memory; the chip was organized in 64k
blocks, thus the min. program space would always have been 64kbytes!)
- Flash-ROM cart 128k / 1Mbit "Atarimax" by Stephen Tucker
(allthough they are not usable as extra RAM / Ramdisk at the moment,
I am quite sure that it is possible to write some drivers and thus
use the Atarimax Flash-ROM carts as extremely fast floppy drives!)
- Flash-ROM cart 1024k / 8Mbit "Atarimax" by Stephen Tucker
(for information and complete documentation plus software see:
www.atarimax.com/flashcart/documentation/index.html)
- and many others I do not know and I do not have any info about;

Even cartridges can be used as Ramdisks (= fast floppy drives),
especially RAM-carts or Flash-RAM carts. But they function like
most other Super- or Mega-Carts, meaning the bank-switching
techniques are also used there. Since the subject carts and
bank-switching carts is quite enormous, I will not discuss it or
present any information here. Just try to find a large description
by John K. Picken ("RAM/ROM Control on an XL/XE") if interested in that
subject (e.g. at Jindrich Kubec`s homepage: www2.asw.cz/kubecj/...).

Finally thanks and credits for this subject and lots of (used /
borrowed) information therefore go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl, Ron Hamilton,
Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard Pahl and
Walter Lojek. Also thanks to John K. Picken who wrote an excellent
article about A8 extra RAM / Ramdisks and A8 cartridges and their
technique of bank-switching. Well, if you still find errors, bugs,
mistakes, etc. in this list, then tell me *nicely* or in a friendly
way. Any updates and corrections can be send to: amp@abbuc.de
-Andreas Magenheimer

8.11 Ramdisk-supporting Software:
(This is version 3.3 from November 2004 by A.M.)

a) support for 64k Ramdisks (RD-block E):

DOS 2.5 (Atari), Bewe-DOS 1.x (Bewesoft), Bibo-DOS 5.x (Compyshop),
Bibo-DOS 6.x (Compyshop), DOS II+D Version 6.x (Stefan Dorndorf), DOS
XE
1.x (Atari), DOS XF (Reitershan), My-DOS 3.x (Wordmark), My-DOS 4.x
(Wordmark), Sparta DOS 2.x (ICD), Sparta DOS 3.x (ICD/FTE), Sparta DOS
3.3x (Stephen J. Carden), Sparta DOS 4.x (cart., John Hardie? or John
Harris?), Super DOS 2.x (Paul Nichols), Super DOS 5.x (Paul Nichols),
Top

DOS 1.x (R.K. Bennett), Turbo DOS 1.x (Reitershan), Turbo-DOS 2.x (Reitershan), X-DOS 2.x (Stefan Dorndorf), A-Base (???), ABBUC-Magazine Intro 52 (Karolij N./Heaven), ABBUC Magazine Intro 55 (Karolij N./Heaven),
Adalmar (Falk Buettner/PPP), Alphasys-Sound-Sampler-Software (Mirage/ANG),
A.R. The Dungeon (Philipp Price/Datasoft), A-Text (???), Atari Writer 80
(Atari), Atari Writer Plus (Atari), Basic-XE (OSS/ICD/FTE), Bop N'Wrestle
(Mindscape), The Brundles (KE-Soft), Datei 4.x (Norbert Schlia), Desktop
Atari (HBSF), Diskcomm. 3.x (by Bob Puff, under Sparta or MyDOS answer "use 130XE RAM?" with "N" and use your XRAM as Ramdisk D8: or D9: when formatted previously with a RD-driver!),

Diskworker (Petsoft), Extended Atari Basic (???), Extended Turbo Basic (???), Fampy 2.3 (Wolfgang Freitag/Friday), Fampy 6.1 (Wolfgang Freitag/Friday), Grafik+Sound Demo (Peter Sabath), Howfen DOS 3.x (???), Howfen DOS 4.x (???), Howfen Tape to Disk (???), Human Torch & the Thing (Questprobe/Saga+Marvel), Inertia 2.9 (MadTeam), I.K. Plus Demo (???), Megablast 1 (Thorsten Karwoth), Mental Age (???), Midi Mate II (Hybrid Arts), Midi Pattern Editor (Radek Sterba/Raster), Midi-Player (Ireneusz Kuczek), Midi Recorder (Ireneusz Kuczek), Midi Sequencer (Maciej Sygit), MSC-IDE Software (M. Belitz, S. Birrmanns), The Muppet Movie (MadTeam), Page-Designer (XLent), Paperclip II (Batteries Included), Spiderman (Questprobe/Saga+Marvel), Sweet Fantasy (Tight), The Browser (Tom Hunt / CTH), Theta Music Composer 2.x (Jaskier/Taquart), The Top 3 Demo (dancing
girl part "Veronika" by WFMH), Typesetter (XLent), The X-Files [Picture] Demo (Shpoon) and most Text-Editors (e.g. Speedscript, Antic Writer, T-Edit, Page 6 Writer, Compyshop-Editor, Textpro, etc.) as long as they are running under a DOS 2.x (DOS 2 derivative) or Sparta / Bewe DOS and the appropriate Ramdisk-driver;

b) support for 128k Ramdisks (ramdisk blocks AE):

DOS 2.5 (Atari), Bewe-DOS 1.x (Bewesoft), Bibo-DOS 5.x (Compyshop), Bibo-DOS 6.x (Compyshop), DOS II+D Version 6.x (Stefan Dorndorf), DOS XF (Reitershan), My-DOS 3.x (Wordmark), My-DOS 4.x (Wordmark), Sparta
DOS 2.x (ICD), Sparta DOS 3.x (ICD/FTE), Sparta DOS 3.3x (Stephen J. Carden), Sparta DOS 4.x (cart., John Hardie? or John Harris?), Super DOS
2.x (Paul Nichols), Super DOS 5.x (Paul Nichols), Top DOS 1.x (R. K. Bennett), Turbo DOS 1.x (Reitershan), Turbo-DOS 2.x (Reitershan), X-DOS 2.x (Stefan Dorndorf), The Brundles (KE-Soft), Datei 4.x (Norbert Schlia),
Fampy 2.3 (Wolfgang Freitag/Friday), Fampy 6.1 (Wolfgang Freitag/Friday),
Inertia 2.9 (MadTeam), Midi Pattern Editor (Radek Sterba/Raster), Midi

Player (I. Kuczek), Midi Recorder (I. Kuczek), Midi Sequencer (M.
Sygit),
The Browser (Tom Hunt/CTH), Diskcom. 3.x (By bob Puff, under Sparta or
MyDOS answer "use 130XE RAM?" with "N" and use your XRAM as Ramdisk D8:
or
d9: when formatted previously with a RD driver!) and most Text-Editors
(e.g. Speedscript, Antic Writer, T-Edit, Page 6 Writer,
Compyshop-Editor,
Textpro, etc.) as long as they are running under a DOS 2.x (any DOS 2
derivative) or Sparta / Bewe DOS and (formatted previously with) the
appropriate Ramdisk-driver;

c) support for 192k Ramdisks (ramdisk blocks ACE):

Bewe-DOS 1.x (Bewesoft), Bibo-DOS 5.x (Compyshop), Bibo-DOS 6.x
(Compyshop), DOS II+D Version 6.x (Stefan Dorndorf), DOS XF
(Reitershan),
My-DOS 4.x (Wordmark), Sparta DOS 2.x (ICD), Sparta DOS 3.x (ICD/FTE),
Sparta DOS 3.3x (Stephen J. Carden), Sparta DOS 4.x (cart., John Hardie?
or John Harris?), Super DOS 5.x (Paul Nichols), Turbo DOS 1.x
(Reitershan),
Turbo-DOS 2.x (Reitershan), X-DOS 2.x (Stefan Dorndorf), Diskcom. 3.x
(by
Bob Puff, under Sparta or MyDOS, answer "use 130XE RAM" with "N" and use
your XRAM as Ramdisk D8: or D9: when formatted previously with a Ramdisk
driver!), The Browser (Tom Hunt/CTH, Sparta DOS only!) and most Text-
Editors (e.g. Speedscript, Antic Writer, T-Edit, Page 6 Writer,
Compyshop-
Editor, Textpro, etc.) as long as they are running under a DOS 2.x (DOS
2
derivative) or Sparta / Bewe DOS and (formatted previously with) the
appropriate Ramdisk driver;

d) support for 256k Ramdisks (blocks 8ACE and/or 26AE):

Bewe-DOS 1.x (Bewesoft, 8ACE and 26AE), Bibo-DOS 5.x (Compyshop, 8ACE
and
26AE), Bibo-DOS 6.x (Compyshop, 8ACE and 26AE), DOS II+D Version 6.x
(Stefan Dorndorf, 8ACE and 26AE), DOS XF (Reitershan, 8ACE and 26AE),
My-DOS 4.x (Wordmark, 8ACE and 26AE), Sparta DOS 2.x (ICD, 8ACE and
26AE),
Sparta DOS 3.x (ICD/FTE, 8ACE and 26AE), Sparta DOS 3.3x (Stephen J.
Carden, 8ACE and 26AE), Sparta DOS 4.x (cart., John Hardie? or John
Harris?, 8ACE and 26AE), Super DOS 5.x (Paul Nichols, 8ACE and 26AE),
Turbo DOS 1.x (Reitershan, 8ACE and 26AE), Turbo DOS 2.x (Reitershan,
8ACE
and 26AE), X-DOS 2.x (Stefan Dorndorf, 8ACE and 26AE), Anime 4ever
(Sente
Software Group, 8ACE), The Brundles (KE-Soft, 26AE), Datei 4.x (Norbert
Schlia, 26AE), The Browser (Tom Hunt/CTH), Diskcommunicator 3.x (by Bob
Puff, under Sparta or MyDOS, answer "use 130XE RAM" with "N" and use

your
XRAM as Ramdisk D8: or D9: when formatted previously with a RD driver!)
and most Text-Editors (e.g. Speedscript, Antic Writer, T-Edit, Page 6
Writer, Compyshop-Editor, Textpro, etc.) as long as they are running
under
Bibo DOS, Turbo DOS, My-DOS or Sparta DOS and (formatted previously
with)
the appropriate Ramdisk-driver;

e) support for up to 1 Megabyte Ramdisks:

My-DOS 4.x (Wordmark), Sparta-DOS 2.x (ICD), Sparta DOS 3.x (ICD/FTE),
Sparta DOS 3.3x (Stephen J. Carden), Sparta DOS 4.x (cart., John Hardie?
or John Harris?), The Browser (under Sparta DOS 2.x, 3.x and 4.x),
Diskcom
3.x (by Bob Puff, under Sparta or MyDOS, answer "use 130XE RAM" with "N"
and use your XRAM as Ramdisk D8: or D9: when formatted previously with a
RD driver!) and most Text-Editors (e.g. Speedscript, Antic Writer,
T-Edit,
Page 6 Writer, Compyshop-Editor, Textpro, etc.) as long as they are
running under My-DOS or Sparta DOS and (formatted previously with) the
appropriate Ramdisk-driver;

Thanks and credits for this subject go to: Bernhard Pahl, Russ Gilbert,
Ron Hamilton and Mathy van Nisselroy for sharing some info with me.
-A.M.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
(This is version 3.3 from November 2004 by A.M.)

a) 64k XRAM required (block E or simply 130XE):

130XE-Bank/Memory-Testers (various programs+authors), 130XE
Sectorcopiers
(various programs from Antic, Analog, Happy Computer, etc.), 130XE
Utilities (HAPS PD 0031), 130XE-Artshow (HAPS PD 0013), 130XE-Autoshow
(ABBUC PD 191, HAPS PD 0637), 130XE-Demo (S.A.G.), 130XE-Impossible-Demo
(Rudy Haegemann), Atari Writer Plus Super Menu (Ken Siders), Amiga-Boink
XE (Bob Armour), Animkomials meet Boris Valleyo (Animkomials+Boris
Valleyo), Boot Majster (Electron), Boss-X (Mirko Sobe, with MyDOS it
supports up to 1 Megabyte XRAM/Ramdisk and subdirs and up to 16 Megabyte
harddisk partitions), Boss-XE (Mirko Sobe, with MyDOS it supports up to
1 Megabyte XRAM/Ramdisk), Bill-Pie-Demo (Mad Team, supports up to 256k
XRAM: AE/8ACE), BMW-Animation (Mirko Sobe), CES-XE-Demo (original 130XE
version with 580 sectors by XANTH), Comet-Ani (MadTeam, supports up to
256k XRAM: AE/8ACE), Critical-Sound-Demo (Innovative), Coolcopy 130XE
(???/authors unknown), CAD-XE (HAPS-PD 0350), Castle of Blackthorne
(Thimo
Graef), Cavepack (XE-Version by Kemal Ezcan), Computer Baseball (Douglas
Blackwell), Danielle-(Gr.9-TB-)Ani (NBS/Bill Kendrick), Degas-View-XE

(Mat*Rat/Mathew Ratcliff), Diskcomm. 3.x (by Bob Puff, if you want to answer "use your 130XE RAM?" with "Y", then 64k XRAM are required!), Diskettenverwaltung 130XE (ABBUC PD 86), Draw XE (ABBUC PD 387), Ergo-Bibamus (Quasimodos, has RD-setup!), Extract Slideshow (Replay/Bit Busters), Fraktale & Colorprint (Peter Woetzel),

Gizmo`s Castle (XE-version by M. Kugler), Grafik Zeilen Editor (HAPS PD 0296), Hi-Res Designer (HAPS PD 0015), Hires Dump (ABBUC PD 113), Inertia
3.8 (MadTeam, supports up to 256k XRAM: 8ACE and 26AE with any DOS), Inertia 4.5 (MadTeam, supports up to 1 Megabyte XRAM: 8ACE and 26AE with any DOS), Igor Demo (MadTeam, diskside 1), Isolation Demo (MEC), Journey (Boot version by Polynomials, up to 256k XRAM: AE/26AE), Journey (File
version by MadTeam, up to 192k XRAM: AE/ACE/8ACE/26AE), Journey into Sound
(DGS/Dean Garaghty), Kaiser II (128k version by Carsten Strotmann), Killer
Whales Ani (MadTeam, supports up to 256k XRAM: AE/8ACE), Lajf-Demo (MadTeam), Landscape-XE-Demo (Karl Pelzer), Megablast-Sounddemo (DGS/Dean
Garaghty), MTV`s-Danielle = Danielle-Ani., Macro-Assembler XE (Thorsten Karwoth), Macro-Assembler-XE+ (Thorsten Karwoth, works with MyDOS only, supports up to 1 Megabyte XRAM), Masher-XE V1.0 (???/author unknown, supports up to 256k XRAM: E/AE/ACE/8ACE), Memdrv10 (Andre Bertram, tests up to 4 Megabyte XRAM, all portbits, standard 16k banks and exotic 32k banks, standard Port B $D301 and exotic Port B $D600), Menu 130 (Les Howarth), Midi Mate III (Hybrid Arts), Minesweeper 1-4 (4 game versions by
J.R.Chicko/S.A.S.), Mister X (Stefan Soelbrandt), Monitors, Debuggers & more (HAPS PD 0109), Multi-DOS 130 (Kuchera/Excellent), Multi-Tasking-OS (various ABBUC magazines), MTOS XE (CTH/Tom Hunt),

[Der] Neffe (XE-version or ABBUC PD 52), Neo-Tracker (EPI/Allegresse, runs
only under MyDOS, TopDOS or Sparta DOS 4.X cart., supports up to 1MB XRAM),
[The] Newspaper-Editor (HAPS PD 0294, similar to ABBUC PD 121 but this HAPS/Bellcom version is in english!), Nascar-Animation (Mirko Sobe), Nonjm
Demo (TIGHT), Owca-Demo (Animkomials), Owca-2-Demo (Animkomials), Oelbaron
(XE-version by ???/author unknown), Programm Verwaltung 130XE (HAPS PD 0434), Protracker 1.5 (MadTeam, supports up to 256k XRAM: 8ACE and 26AE, with any DOS), Parrot-XMAS-Demo (Anthony Ramos), Pedrokko-Sounddemos (Pedrokko, 10 Disks / 20 S.), Rechnen fuer Kinder (ABBUC PD 85), Rund um die Ramdisk (ABBUC PD 383, HAPS PD 1084), Raving Vierpz (Pentagram), Raytracing Animation (Karl Pelzer), Sample-Art-XE (Mozart/WSL, supports up to 1 Megabyte XRAM, alas it is buggy!), Shrink-XE (Peter Fitzsimmons),
[The] Small Printery (Walter Lojek, supports up to 1 Megabyte XRAM: 8ACE

and 26AE), Snapshot (???/author unknown), [The] Sound Utility (CTH/Tom Hunt, supports up to 1 Megabyte XRAM: E/ACE/8ACE, bug-free only under Sparta DOS!), Space Harrier (Sheddy/Chris Hutt), Strategy Baseball (HAPS PD 0302), Super-Print-Lab-XE (HAPS PD 0909), Sweet Fantasy (Tight),

Shiny-Bubbles (XE version by Brian Paul), T-34 (ANG/Mirage), Tape-Copy 130 (Joerg Gernreich), Tape-Ramdisk-Drivers (Pokey & SAG), Text-130 (B. Russmann), Textpro "+" (e.g. 4.54+ by Ronnie Riche), Textpro 5.x (Ronnie Riche), The Code Cruncher 3.0 (Soused Teat/A.Bienias), The Cruncher 5.0 (MSL/Magnus), The [Sparta DOS] Wedge (Ed Bachman), The Works (CTH/Tom Hunt), The Asskicker (Shadows), The Turtles-Demo (Ultra-Software), Total
Dazed (Tight), Trip 6 (Shadows), Too Hard 2 (Animkomials), Ultra Demo (Taquart), Vengeance (Excellent), Vent (Excellent+Pentagram), Video Blitz
(Helvetica Bold, also requires sep. Antic access!), WAF-Demo (W.A.F., two
parts of side 2!), [Die] Wuerttemberger-Disk (ABBUC PD 361, HAPS PD 1050 because side 2 contains the XE-version of Gizmo`s castle!), XL-2 (John K. Picken, supports up to 1MB XRAM, depending on the DOS!), Xyberscape-XE
(XE-version by Bill Le Masurier), X-Files Animation-Demo (Mad Team), Zero
Demo (New Generation), Zargon XE (ABBUC PD 611, HAPS PD 0485), [Der] Zeitungsredakteur (ABBUC PD 121, german!);

b) 128k XRAM required (blocks AE):

192k-Memory-Testers (various programs by various authors), Diskcom. 3.x (by Bob Puff, answer "use your 130XE RAM?" with "Y" and also answer "use additional RAM?" with "Y" to use full 128k XRAM), Igor Demo (MadTeam, diskside 2), Revenge of Hacker (Rasero Team), Too Hard 3 (Animkomials); Note: Quite a lot of 128k programs (block E) do also support 192k memory (blocks AE), just take a look above ! And all the programs that support up
to 1 Megabyte XRAM do also support 128k XRAM, see above...

c) 192k XRAM required (blocks ACE and others):

256k-Memory-Testers (various programs by various authors), Atari Writer Plus XE + Super Menu (Ken Siders), Dream Vision (ABBUC PD 480), MTOS 256 (CTH/Tom Hunt), American Natives (Fox-1, choose your DOS and RD-driver!),
Impossible but Real (MacGyver, has an auto-setup!), Reditus (Zelax, has an auto-setup!), Tit Demo (MadTeam, has an auto-setup!); Note: All programs that support up to 1 Megabyte XRAM do also support 192k XRAM, see above...

d) 256k XRAM required (blocks 8ACE or 26AE):

320k-Memory-Testers (various programs by various authors), APC-Archiver 1.0 (LBS/APC, 8ACE only!), APC-Packer 1.1 (LBS/APC, 8ACE only!), Audio/

Studio Master (ANG/Mirage, 26AE only?!), Back to Life 2
(Jaskier/Taquart,
has an auto-setup!) Kaiser II (320k version by Carsten Strotmann, 26AE &
8ACE), Multi-DOS 320 (Kuchera/Excellent, 8ACE only?!), Base-33
(AIDS/AIDZ,
26AE & 8ACE, hold down SHIFT upon bootup for setup!), Cogito-Demo (AIDS
/
AIDZ, uses banks 8C, thus 8ACE only!), Edelweiss-Demo
(A.R.+C.S.S.+S.V.L.,
26AE), Glasshead Demo (A.R.+C.S.S., 26AE), Halle 1994: The Wormhole
(Magic
Arts, 26AE), (Atari) Hardware-Demo (A.R.+C.S.S., 26AE), Imperial [Sound]
Demo (Innovative, 26AE & 8ACE), Khai-Et (AIDS/AIDZ, 26AE & 8ACE, hold
down
SHIFT upon bootup for setup!), Numen Demo (Taquart, 26AE & 8ACE, has an
auto-setup!), P.I.T.-Demo (Quasimodos, 26AE & 8ACE, has an auto-setup!),
Raytracing 320k (Elsni/Stephan Elsner, 8ACE only!), Sheol Demo (Bit
Busters, 8ACE only!), Stash-98-Demo (Rasero Team, 26AE and 8ACE, in the
first menu press A for 8ACE Ramdisks, else press B for second menu -
then
press C for manual Compyshop setup!), Starwars-Demo (A.R.+C.S.S., 26AE),
The Wormhole (Magic Arts, 26AE), Timekeep(er) (New Generation, 8ACE
only!
wait for depacking!), Too-Hard-4 (Animkomials, 26AE & 8ACE, has an auto-
setup!), Trabant Demo (A.R.+C.S.S., 26AE), Worms-Demo (Datri, 8ACE),
X-Demo (MadTeam, 26AE), X-Files 2 [TV-Intro] (MadTeam, 26AE & 8ACE);
Note: There are some 128k programs that also support 256k XRAM; and all
128k programs that support up to 1 Megabyte XRAM do also support 256k
XRAM
(8ACE and/or 26AE), see above...

e) 512k XRAM required (32 banks):

576k-Memory-Tester (various programs by various authors, e.g. a test
program by Scott Peterson); Note: All 128k programs that support up to
1 Megabyte XRAM do also support 512k XRAM, see above...

f) 1024k XRAM required (64 banks):

1088k-Memory-Tester (various programs by various authors, e.g. a test
program by Newell); Raytracing 1MB (Solocoder of A.C.E., works only on
Klaus Peters 1MB-Megaram 3 ! Boot version with 8 disksides; loading
time:
approximately 17 minutes!); Note: There are quite some 128k programs,
that also support up to 1 Megabyte XRAM, see above...

g) 2048k XRAM required (128 banks):

2112k-Memory Tester (have not seen one yet!);

h) 4096k XRAM required (256 banks):

4160k-Memory-Tester by ICD and later FTE;

Thanks and credits for this subject go to Russ Gilbert, Bernhard Pahl,
Ron Hamilton and Mathy van Nisselroy for sharing their info with me. Any
corrections and/or updates are welcome. - Andreas Magenheimer

---

Believe it or not, this version is shorter than previous (2.x) versions.
greetings, -Andreas.

3776. Re: How to convert full-disk games to files?

> (fix reply to for email)
Thanks for the suggestion to ask in atarimax flash forem.
I found my problem and have suggestions for Andreas's question what
maintenence needs to our beloved A8s.
There's nothing wrong with my Flash cart. I just won't burn using my
modified 800XLs. Burns fine using 1200XLs. And burns using a stock 800XL.
Will not burn with my Newell Ramrod Omnimon dual OS mod 800XL, won't burn
using my Newell 256K 800XL, won't burn using a stock 130XE, will burn using
1200XLs and a stock 800XL, won't work right on stock 800s.
I burned the SpX 4.22. The cart won't work in my mod 800XLs, works fine in
the 1200XLs, stock 800XL. I have a SpX cart, it works on one 1200XL, but
not the other, works on stock 800XL. It seems like I remember it worked on
a stock 800.
To summarize, I'm getting inconsistent results with both the ICD SpX and the
4.22 burned Flash cart.
This gets to the question Andreas Maggenheimer asked Michael Current in a
more recent thread 'what maintenence needs be done on our A8s?'.
I'd guess that soft pencil erase cleaning of cart contacts is one thing.
I'm suspecting oxidation of both the cart contacts and the cart port on the
computers. I also experienced keyboard problems on my 1200XLs. After
hitting the keys multiple times, they started to work with a single stroke.
Here again, I suspect oxidation on the 1200XL keyboard contacts. I don't
know what kind of contacts the 1200XL keyboards have. I know my oldest
800XL has copper switches in the keyboard, later 800XLs had the membrane
type keyboards.
The suggestion I have? USE YOUR A8! I've left mine sitting in boxes for
years and I believe oxidation on contacts is a significant problem.

Now, I remember why I don't like SpX. There is no 'RUN' command. eg. you
can't RUN E477 to do a warm start. Second, I can't load my binary load
BASIC on 1200XL, I would guess because I didn't append a $2E0-1 RUNAD on it.
Sparta 3.x will run at the last load address, I think DOS 2/2.5 and maybe

MyDOS require the RUNAD at the end. I need the 'RUN' command. SpX also has high speed I/O, I think there's a way to turn it off, but I remember it screwing up real disks.
Thanks

I don't think it is better than any in its' class, Z80, 8086. The speed of a CPU makes for a better chess program, and 4 mz isn't going to be like what a chess program can do at 4 gigaherz. The more iterations a CPU can do in a time span, the better it will search a tree for a good move.
About chess programs in general. Most are repetitive, ie. they make the same moves every time you make the same moves, this is a weakness, not so much fun, you'd like it to be more random, maybe picking the second best move.
The old 8-bit chess programs are more fun for me because they are about my speed in chess. PC chess programs, like ChessMaster can be stronger than 95% of players. I rarely beat ChessMaster 3000 on a 666 mhz PC. The new ChessMaster is annoying because of its copy protections (some things never change), if you don't play it for two weeks you have to insert the CD, many games today require the stinking CD in, then there's the annoyance of 'autoplay' when you leave a CD in. CM 7000 I have and almost never play. You can get it to play a weaker game, but it insists on same time controls for computer and player if your are playing a rated game, I don't think deeply like I used to, so I play fast and don't want the computer to artificially take a long time, the computer can play instantaeously, no need for time.
I've rambled.

It's relatively simple. Generate a hash of the every line of text from
the spam and store it. Strip quotes out on new messages and process every
line. If the hashes match up more than X times, flag the reply as spam.
bam the whole thread is killed. People who write software are usually too
busy to implement crazy features like that ;-)

That and it'd be a cpu/ram hog and a half and most people try to prevent
stuff like that, nonetheless the compile-time option would be cool ;-)

Thanks Andreas!

It can be used with 2 Ataris, 2 modems, and floppy, and a telephone
line, but really I was thinking it will work with APE (the R:
emulation with APE) works fine. I connected my Atari800Win to my real
Atari via APE for 2 player mode.

> Besides, the game seems only to work under Sparta-DOS format, with DOS 2

The version I submitted to ABBUC had a "loading" problem that I found
later (after submitting the game in October). I have fixed this since
then, so it will now work under other DOSes as well. Which means that
the ABBUC version is one player only under a gamedos. Sorry!

I am fixing several issues currently, so do not want to release it
just yet. But, a more functional version is coming... sorry for the
delay, but for now you will just have to wait. :)

I posted in another thread. The main suggestion I have is to use your A8s.
This keeps the keyboard working. I didn't have a problem with my 800XLs,
but my 1200XLs required typing the keys a bunch to get them to respond to
every keypress. USE YOUR A8s.
The problem, I suspect, is oxidation of contacts, in the keyboard, at the
cartridge slot, maybe the SIO port. Use of a soft eraser on cart edge
connector is one thing I think helps.
I would guess one could take the 1200XL keyboard apart and clean the mylar
traces with ??? 90% isopropyl alcohol and a Q-Tip. I still have my
original 800XL, it has copper switches in the keyboard, no mylar. I don't
know what my 800s have in the keyboard, but I would guess copper switches.
My original 800XL has all socketed chips also.

If you go to the search engine Google, and type chess 8-bit, there are a lot of chess games listed for 8-bit machines that come up including the Atari home computers. There are a lot of reviews that may be helpful. But to answer if the 6502 was a good chess CPU, I don't know.

the save-with-replace bug was fixed relatively early. the 1571 disk
drive does not have it.

i don't agree here. the xf551 is way too hard to get and if you get one
you pay lots of bucks for it. 1050 is the best choice.

Sounds good Mathy. I am doing the same thing with the 8-bit drive
emulator program 800XL-DJ. I am extracting the files from ATR
images and making bootable DI image files that I am putting on CD
that will run on Atari clone the Hades 060.

I have been given a ALLDATA automotive computer, inside is a Atari
1040ST main board.
This computer has one floppy drive on the back and a SCSI cdrom on the
front for which I have many automotive repair discs.
Here is my problem, I turn on the machine and it attempts to read the
cdrom, and floppy drives. times out and then boots to what looks like
an Apple interface, I then have tried to read the original boot disk
that came with the machine, no go, will not format a blank 720k disk
either.
I have opened the machine, blown out with compresed air, unplugged and
plugged back in all cables, and removable chips.
It never had a keyboard, though a phone looking jack is on the front,
it was always used with a mouse.
Most of the machine appears to work but just can't read the drives.
I'd really like to be able to use this machine and would be gratefull
for any help.
Thanks to all that can help.
Douglas

> ...

I have read your story and I like it.

I and a friend once wrote an action game for the Atari 400/800/XL/XE computer, called "Street Killer". Tasteless, but still a cool programming project typical for the early 1980s, when it was possible for one single person to write a best-selling, state of the art computer games.

In our case it was 1984, and definitely not a state of the art computer game.

The game was saved on tape, then lost. I thought it was gone forever. But after 15 years, I found it while test loading files from tape.

The "Street Killer" game was indeed a crappy prototype-ish game with some interesting elements.

Anders

Howdy "The Wanderer"

> I don't get it -- I thought the Atari couldn't address any space over
> 256MB?

MyDOS, Sparta and BeWeDOS will address 16 MB.
The BlackBox will allow partitions to be 64 MB.
The BlackBox partitionlist is limited to 96 partitions (of up to 64 MB if somebody writes the DOS to support that, or up to 16 MB at the moment). There's no real limit to the amount of partitionlists you can use. The Blackbox loads the correct Partitionlist if you go to BlackBox menu option B, change the sector at which that partitionlist starts, then go to BBmenu option A and load partition via P from there. Matthias came up with a methode of keeping track of where all the partitionlists are. This limits us to 65535 partitionlists at the moment. But I'm sure we can come up with a way to expand that if we ever need to. The BlackBox can address up to 4 gig for sure and maybe just maybe even twice that much.

Check out the information on my site. www.mathyvannisselroy.nl

Yes, but the addition of one chip (74LS74) to create a new Phi2 clock signal should cure them all. Check out my site at www.mathyvannisselroy.nl There should be a small piece of text on how to do that (IIRC).

3799. Atari Microsoft Basic Question

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-07 01:49:15 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041106204915.21945.00000303@mb-m06.aol.com>
Source record: 14056

I'm writing an application in (the little used and much maligned) AMSB, and I've run into a problem trying to read a LISTED file. I've successfully OPENed the file and assigned an IOCB, but when I try to read a line using LINE INPUT, I get nothing or a SYNTAX ERROR.

```
240 CLOSE #1: OPEN #1, FILE$ INPUT
310 LINE INPUT #1,LLINE$
```

I've tried several variations of line 310, but can't get it to work. The MSB manual only references inputing a complete line from the keyboard, so maybe this be can't be done. But I'd think that since it uses an IOCB, it wouldn't make any difference. (?) IIRC, this works in GW BASIC without a hitch. There is also a LINE INPUT...AT, but that is only set up for a disk sector/byte or screen input. I can probably drop back to using GET (bytes) from the open IOCB, but LINE INPUT seems a lot cleaner.

Any ideas (other than why don't I use another BASIC)?

-Larry

Ahhh -- found the problem. The first character of the LISTED file was an EOL
155. The LINE INPUT does work with the disk file -- I just needed to keep on
and get past the initial EOL. I don't recall running into an EOL as the first
character in a text file before, but live and learn!

I've placed my photos from Day 1 of the VCF 7.0
(the 2004 Vintage Computer Festival being held in
Mountain View, California this weekend) online:

http://www.newbreedsoftware.com/bill/photos/vcf70/

My exhibit booth has an Atari 800XL, Atari 2600 Jr and two Atari Lynxes.
I'm also showing off the following contemporary stuff:

Stelladaptor (connect Atari joystick to PC)
AtariMax flash cart (store programs or a disk image on a cart)
SIO2PC cable (boot Atari off of a PC)
Burger Drop ("Burger Time" game clone for XL)
Space Harrier XE ("Space Harrier" game clone for XL)
Jellybeans (puzzle game for XL)
DynaBlasters ("Bomberman" game clone for XL)
MicroUSB (a USB host cartridge for the Atari)

Unfortunately, the USB devices I have (a keyboard/trakball combo and
a steering wheel I borrowed from someone) don't seem to work well with the
current drivers, so I can't actually demo it. (I did print up 100 flyers
with photos, information, and the MicroUSB website address.)

I chose not to participate in the judging/awards, since I'm just there to
have fun.

If you're in/near the San Francisco Bay Area, the exhibit floor is open
again tomorrow (Sunday, November 7th, 2004) from 2pm to 6pm. Drop by and
say 'hi!'

Enjoy the photos! (If I take some tomorrow, I'll post more at the same
address.)

I'm giving up business until end of 2004 and still have large qts. of
hardware and games.

Please note : I cannot ship single games, because min. shipping of a package is
$35 (for up to 35 games).

Payment is possible with paypal.

ATARI XL/XE games are NTSC.ATARI 2600 games mostly PAL when NTSC isn't
mentioned.

Contact : webmaster@klassische-videospiele.de
or lord-chaos@t-online.de

All games new & boxed.

Thimo

Hardware :

CX-30 Paddles , ATARI, new and boxed , $8 , ca. 20-30 available
CX-50 Keyboard Controllers, new and boxed, $6 , ca. 100 available
Telegames Joysticks , new and boxed, $5, ca. 100 available

Footpedals, ca. 800 available, $1 each (heavy), $0.50 if you take them
all.
(They take a lot of space and I have to throw them away if nobody buys
them).

Sears Paddle/Joystick Controller, $3, ca. 100 available

GAMES :

(*) means 20+ copies available

ATARI 2600 :

5.00 Acid Drop (Salu)
5.00 Adventure on GX-12 (Telegames)
5.00 Alpha Beam with Ernie (ATARI) Kids Controller req.

that's not true for all the cases, as you can use a software like
iron hacker to freeze the fulldisk game and make it file. there are
lots of 'cracked by iron hacker' file versions of games.

> probably too complex and big to make into an .exe. If you have copy

a game M.U.L.E. already exists in a file form - in fact those are
two files, the second one is read after you're done with choosing
planeteers and proceed to planet IRATA.

3813. Saving all my old 800XL program disks

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-10 03:08:55 UTC
From: Chuck <clm701@hotmail.com>
Message-ID: <10p31blrpvrbifc@corp.supernews.com>
Source record: 14070

I as many did kept a few copies of each and every disk I had back in the day. When I sold my Atari 800XL, the buyer already had every program I had, and only took my Atariwriter and Paperclip OEM disks. Well its been many years now since I sold my stuff, I don't have an Atari or know of anybody here that has one, and I still have all those old disks. I was cleaning my garage out today when I came to the shelf where I have stored them for years, and after opening the old dusty box and looking through them, old long forgotten memories came flooding in. For a few moments I was 16 years old again, and there I was back in a time I had long since forgotten.

It would be nice to be able to somehow take all those programs, a few I wrote myself, and somehow save them, that is if they have somehow survived being stored in my garage over all these years. Just wondering if there was any product or kit that would allow me to do this or if there was anybody in North Dakota or near Minot that could do this or just has an Atari system up and running that could check and see if the disks were even still readable.

Thanks
Chuck

Source record: 14071

The disks are probably pretty much OK, the same as they were 15 years
ago. I did mine a couple years ago, copied them off to images on my
PC, and nearly all read like they did last time I used them. Same bad
sectors in the same places... The best way to archive might be to
get them read by someone with a couple Atari floppy drive on an sio2pc
cable to a PC.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

> It would be nice to be able to somehow take all those programs, a few I wrote myself, and somehow save them, that is if they have somehow survived... <

If they have been kept dry, they probably have survived. If (as most are) Atari single density (FM format), they pretty much can only be read with an Atari drive. For a lot more info about transferring, check the most excellent FAQ's (link) under "Welcome to comps.sys.atari.8bit!". You'll probably want section 10.

On the brighter side, most every game that was popular and tons of other stuff can be found as ATR disk images on the web, and most are usable on an emulator. And by now, the emulators are excellent and still getting better each year!

Does anybody (other than Jerzy) have one of these? Are these authentic? I bought a MyIDE a while back but have yet to use it.

I still own my BlackBox, but it gets only rare/occasinal use. It would be nice to stick a 20gb laptop IDE hD into the 8bit and be done with it.

Responses appreciated.

You might be interested in the Image Manager I wrote for the MyIDE
interface. It lets you assign names to the image slots, among some other
features.

Well,
All those number are the disks number from my "private" collection of
disks
So, it go from 001a.atr (and the other side 001b.atr) to almost
700.atr if i remenber well.
the listing is on disk 000a.atr
or, you can download and/or view the listing/the disks here too :
http://the-redraven-site.chez.tiscali.fr/
Hope you'll like it.

3824. Atari XL/XE USB Cartridge Now Available!

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-11 23:33:17 UTC
From: Steven J Tucker <classics@atarimax.com>
Message-ID: <1FSkd.28038$Qv5.10194@newssvr33.news.prodigy.com>
Source record: 14080

I happy to announce that in co-operation with ABBUC, the Atari XL/XE USB Cartridge is now available.

The cartridge is professionally produced, with all open-source software.

Pre-ordering begins now and ends with shipments starting 12/01/2004.

Limited edition pricing is $39.99 per cartridge (about 31 Euro). After 12/01/2004 the price will increase to $49.99.

For complete product information and the order form go to:

http://www.atarimax.com/usbcart/

Highlights:

:arrow: USB 1.1 Chipset compatible with 'Low' and 'High' Speed Devices.
:arrow: Hardware and software designed by ABBUC, the largest Atari 8-bit Users Club in the world.
:arrow: Open source software development.
:arrow: Hobbyist oriented design, no surface mounted parts.
:arrow: Highest quality color labels.
:arrow: Early beta software already shows great promise.
:arrow: PCB includes full layout for future 'slave mode' components.

ABBUC will also have cartridges available for purchase by its members and possibly on thier web page as well once product starts shipping.

If the 800 version of the MyIDE interface uses either $D100 or $D500 and
also the ide config RAM locations need to be the same as well. I don't
have any detection for anything else. If I knew what the locations used in
the 800 version were, I could add support for it (if it doesn't work right
now.)

Hi Shawn,

I have tried to use the Image Manager, but is all I get is a notice the I
don't have the setup correct. I have the ROM installed in the Atari not
loaded from Diskette. The ROM boots the hard drive and I have several
partitions and many images loaded that I can use with START Reset and
selecting the number that I want. I have the Hard OS ROM burned and
selected with the switch for booting MyIDE harddrive, but everytime I run
your program it gets the not setup correctly notice. What am I doing
wrong..? I have a 130 XE and it boots to D1: with D2: set as my APE SIO2PC
Drive..

Eager to use Image Manager,

Roy Dean

Ah! I haven't burnt an image onto ROM yet for my setup, but I thought that
Mr. Atari had tested it with his... maybe I'm mistaken though.

What version of the ROM do you have? I used the source of 3.1 as a guide
for where to find all the locations.

At that point my software is looking for the flags/config settings at $03ED
with the internal interface. Is it saying that the hardware is not
initialized, or that the image space doesn't appear to be setup?

As the code is revised, can the cart be "flashed" to update it?

Is it *likely* that the Atari will ever be able to handle more complicated/faster devices such as floppy/ZIP/Hard drives? That would usher in a whole new era.

(Now if we can ever get the CPU "unstuck" from 1.79MHz and get a good 80-column display, we'd be ready to step into the 1990's. ;-)

Hi Shawn,
The error is:
ERROR!

The MyIDE hardware doesn't appear to be
initialized. Make sure the hardware is
connected and MyIDE OS is installed.

press any key

I then press a key and the image manager dumps me back to DOS.
I will try switching off my OS on chip and use Soft OS to see if this

program will run with Soft OS..
Thanks for any help!

The cart contains no memory, just the USB host controller and interface to
the Atari computer and USB bus. So you just load the drivers from disk at the
moment.

Though eventually someone may come up with a way to make a much larger OS module
that contains things like IDE and USB drivers that are pluggable in some way.
But thats
another project all together. :)

I am not (yet) involved with writing any drivers so I can say what is or isnt
possible with
the Atari CPU. The chipset is a modern USB controller and certainly can speak
to any
USB 1.1 device, either low or high speed.

Until more people have the finished carts in hand its difficult to say if
anyone will take the
time to write larger more complicated drivers.

Steve

In my infinite wisdom, I managed to get two of these. I have the cart and manual, and both are in excellent condition. Anyone who wants to drop a couple bucks for shipping is welcome to it.

I added the rest of my photos from the event (photos from Day 2: Sunday)
late last night. They're on the same page, just scroll down to the part
that says "Day 2" :^)

Day 2 seemed to have more attendees, and my booth got attacked by children
for a lot of the afternoon. It was fun! :^)

Enjoy!!!

I think at the moment they have drivers for keyboards and steeringwheels. :^)
I had one that I brought to VCF 7.0 last weekend, but sadly the steeringwheel
and keyboard I had didn't work. :^(

Personally, I'm interested in memory devices (like Compact Flash card
readers) and USB ethernet. That'd rock!

Several. Personally, I am using the Stelladaptor 2600 (plugs into any
USB port), but on eBay I also found adaptors plugging into the PC
gameport (apparently, a driver software is necessary to use these, while
the Stelladaptor runs without additional software).

Sorry for semi-OT because Atari lynx is not really an 8bit, but I don't know how I can post this message, since all other Atari groups are not so "full" of messages :)

I'm looking for a cheap, working, Atari Lynx. Also without box, since I should play with, also without games, I already have a lot of them.

The important is: it should be fully working, of course :)

Please make your offer including postal expenses. I live in Italy.

Thanks in advance!

someone would probably have to write a driver for that or any other
device that the cart does not supply a driver for. this should change
once the usb cart has wide distribution.

Hi,

> Is there any adapter available that would allow me to plug an old Atari-
> style joystick into my PC gameport? =o)

Yes. I'm personally using my "El'Cheapo" adapter. No active electronics,
only a couple of resistors and two "Sub-D" connectors is all you need to
built one. You'll find the schematics for this adapter in the "Atari++"
archive. However, note that this doesn't convert digital atari joysticks
to analog ones. It is an interface that is just sufficient enough to allow
a program to read out the joystick position and thus requires additional
software support. The Atari++ emulator has this software built-in, of course.
Linux or Windows natively don't, thus this thing won't work with any other
emulator.

So long,
Thomas

Yes, I have MyIDE OS ROM on chip and it is version 3.1. I got it fixed, but
I had to start from beginning with a different hard drive, and everything is
working now. Now is all I have to do is get 3 months of file coping back on
the new hard drive. But it is a lot faster now with your Image Manager, and
having done it once I should be able to get it done in a few weeks. Happy
holidays to all Atarians!!

Great news!

I am working on version 2.0 which addresses a couple of problems in the
design of the program and should make finishing the sort and defrag program
easier on me. I'm adding a larger sector buffer for the image copying as
well, trying to speed that up. A few other features as well, unfortuantely
the image description format won't be compatible, but I may write a
conversion program for that...

I hadn't heard of Jeri's C64-On-A-Stick project - amazing!
Busy girl, no wonder she hasn't written for ages.

What's the company commissioning these stick projects?
And how much do they pay? :-)

I saw the 2600-On-A-Stick a while back.

I'm working on an Atari 800XL in FPGA. The games would beat the 2600 and be
on a par with C64.
Plus you could load other games/apps through a USB port!

Right now I have 512K RAM, 256K ROM, RGB video out, PS/2 kbd/mouse, hardware
crosshairs/cursor, smooth vertical scrolling, printer port and RTC. USB
slave port to replace printer slave port real soon.

I need to get working: display lists, PM graphics, sound, joysticks,
paddles, Atari BASIC.

I don't like to announce this project before it is ready but there are
others snapping at my heels.

Anybody got any features they would like to add to a wish-list?

LCD output?
PC-monitor output?
Stereo sound generation?
80-column text?
65C816?
Battery backed RAM?
Memory card?

IIUC, it is Commodore World, i.e. Tulip and Ironstone Partners,
although the C64DTV right now doesn't sell through their own web
site but exclusively through QVC shopping network.

Would this be sanctioned by Atari/Infogrames? I have a feeling if
you sell finished units and not just put a DIY description on a
web page (or even then), you may eventually hear from them if you
haven't before.

Interesting. Makes sense, as they own the rights to the essential firmware.

Atari are long dead in the hardware market.
IIUC, some company just bought the name for their games software business.
None of the original team are there. The only reason they might pay for
expensive lawyers is if they feel they are losing even more money (e.g.
being associated with other people's shabby products) or they could make
lots of money (e.g. if the ancient games libraries sold truckloads).
Personally I suspect they are busy chasing the mega-millions PC/Console game
market. A few nostalgic nerds are hardly worth it.

From my point of view, I am making a general purpose FPGA application
platform.
It can be loaded with bit patterns to make it emulate various machines,
including vintage computers.
In this aspect it is no different than a PC running emulators.
I don't claim or imply my project is anybody else's branded product, nor
would I provide anyone else's ROM images with it. PC emulators do the same.

I'll call it a Polymorph machine if it keeps other companies off my back.
:-)

If users wish to load bits they do not own into the Polymorph, that's their
lookout.
Nobody has yet managed to sue the makers of iPods, VCRs, CD/DVD writers,
guns, TiVo etc for the actions of their users.

So, anybody got any wishes for the Polymorph project?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hmmm, it sounds akin to the C1 Reconfigurable Computer (a.k.a. the
CommodoreOne).

Exactly.

However, they differ in scale.

Jeri's C1 has the footprint of a desktop PC, and uses two FPGA chips.
It uses a desktop case and PSU.

My gadget uses one FPGA, fits in a smaller case, and powered by a wall-wart.
Maybe by batteries eventually.

Jeri's project is like one of those big classic American cars that has been
thoroughly rebuilt and hot-rodded with nitrous. Mine is more like a
motorbike. You can enjoy both, but in different ways.

Man, how I envy your being so close to that action. I was living up in Watsonville (20 minutes north of San Jose - over the Santa Cruz mountain) the last 2 years, but I've had to relocate back to Utah (family hated CA).

I only got into Mountan View, San Jose a few time while I was living there, and we mostly hit the Olive Garden and restaurants in that area.. or I'd buzz down to Weird Stuff in Sunnyvale to see if they have any interesting items to pick up.

Not necessarily. The developers are housing it in PC cases, but
that doesn't mean the C1 board cannot be put into something smaller.

> My gadget uses one FPGA, fits in a smaller case, and powered by a wall-wart.
> Maybe by batteries eventually.

The C1 board uses very little power. 3.3 volts and a tiny bit
of amperage is good enough to get it going.

> Jeri's project is like one of those big classic American cars that has been

Well, lots need to be use WITHOUT Basic so with OPTION key pressed in
real Atari
or in emulator.
Some need basic, some need translator (or play only on 400/800)
And, always, the download need to be binary (if you can choose...)
I've put it all long ago and download some just to see if it's OK, and
all was right...

yes, it's called a 9pin dsub Serial port 99% of pc/macs have got them,
there is pc drivers available somewhere around the Atari-8bit websites,
cant mind which as i ran an Atari CX-40 joystick on a PC/XT about 8 years
ago and it worked ok.

Ehem, are you sure this wasn't some kind of an April 1st joke?
Basically, the serial port has a completely different layout and
function, leave alone that not even all pins are connected. You could
even cause short-cuts on the port by connecting a simple Atari joystick,
which is just an array of switches.

In other words, I express my high doubt about this being possible, but
you're welcome to prove me wrong. (-;

So long,
Thomas

Hi Thomas, 100% no joke, anyway have you looked at the insides of a serial mouse as it usually only has 6 wires too, basically you plug it into a 9pin serial port and run the driver which is a com/exe file, just like a mouse driver, which gives you a 1 button mouse stick, the driver i got would only work in msdos.

Andrew Mcintosh

This morning I was at home due to some flue-illness. I watched some TV and I saw the programm: Sesamstreet (in the netherlands this is called Sesamstraat btw.)

there was a scene with Elmo and a working-man (making the "M")! On the background there was some kind of cupboard with all kind of stuff, and guess what!!!!!! In this cupboard I saw 2 atari items: an atari 400 and a 1027 printer!!!!!!!!!!!!!!!!!

I did not believe my eyes, but i'm sure about the atari 400... the 1027 might be something else.

Does anyone know more about this scene, and are there more scenes in sesamstreet with atari stuff?

Marius

Hi!

Is my interface on the way or what? I ordered one some weeks ago, but still
haven't seen it. Let me know if anything has gone wrong!

> serial port and run the driver which is a com/exe file, just like a mouse
> driver, which gives you a 1 button mouse stick, the driver i got would only
> work in msdos.

A serial mouse is called serial mouse because it has a serial port. So no wonder this works. It is not only the number of wires that worries me. It is the connection between them. For example, the joystick "forward" switch on an Atari style joystick port connects between pins 1 and 8. (Forward and GND). In a standard PC serial ("COM") port, pin 1 is "data carrier detect" and pin 8 is "clear to send". Both pins are input pins.

Now, please enlighten me how to get any information about an open or closed switch between two input ports.

So long,
Thomas

Well, that certainly is enlightening. It is nice to see a glimpse of the
80s and our own loved computer which kept us entertained for so much of our
lives, being shown on a television show like that.

What do you guys think of those nice new 80's Game Joysticks, where the joystick holds a whole bunch of games in it, you just plug it right in to the television.

I've seen Pacman, Centipede, Asteroids, Frogger, the list goes on. And one of the joysticks looks exactly (well, maybe a little larger, but not much) like the old Atari Joystick. The one joystick that I felt was easiest to handle out of all those other fancy ones.

Hi Kryten,
Is this project an actual hardware implementation of an Atari 800 in
FPGA or a general purpose computing platform that can emulate an 800 ?
Subtle difference.

I have a full POKEY in FPGA ;-)

3.5" disk interface
Hard-disk
ISA card interface
PCI bridge
Network

Regards

Mike Mnemonic

Well, Sesame Street's been around forever. Was it a /new/ episode, or one
from 20 years ago? :)

I remember seeing a rerun of the Mr. Wizard science TV show back in the
early 90s, and he was showing the inside of an Atari computer. :)

I played, briefly, with the Atari 2600 stick that had Adventure in it.
I was displeased to see that my player (the little yellow dot) was not the
same color as the walls! It looks like the games were rewritten, or
something (rather than emulated via software or FPGAs).

I saw Jeri Ellsworth's Commodore-64-in-a-stick. It's frickin' awesome.
Since, inside, it really is a remade C=64, it looks flawless.

We need that for Atari XLs! :^)

> Subtle difference.

I think I know what you mean.
The PC could be the latter for example.

I don't think I can publicly call it an Atari without the trade-name owner's
endorsement.

It would be the latter really, but of course it emulates old machines with
an FPGA instead of a CPU.

It could emulate other machines that have already been done in FPGA.
I haven't ported them yet, due to time, but shouldn't be too hard.

> I have a full POKEY in FPGA ;-)

I have a PS/2 keyboard interface, and the sound generator & pot interfaces
look fairly easy.

> 3.5" disk interface
> Hard-disk

FDC chips are fairly rare outside of PC support chipsets.
Besides, FDs are increasingly rare. My laptop doesn't even have one, nor
RS232.
Just LPT, USB, and memory card slots.

Hard disks are easier to interface to via IDE, but they are still quite big.
Right now my project sits in a case that is 220 x 100 x 30 mm internal.
I think it could shrink to 130 mm long for now.
If it ever got mass produced, as a couple of chips in epoxy blobs, then
we're looking at beermat size.

Anyway, a 3.5" FDD or HDD would be about the same size as my project!

Given these constraints, I think it will have to be Compact Flash or SD
cards.

The XL only has 64K, so you could fill it at least a thousand times over
with a cheap 64MB memory card.

I suppose I can make the FDC/HDC a separate item for heavy users.

The core project could eventually be something you can throw in the back of the car, or drop accidentally.

> ISA card interface

Again PC ISA cards are obsolete. What would you want it for?
A 6502 could use an ISA serial/parallel I/O card, but not be practical for a VGA card.

However, I might put the signals on a PC104 connector.
The pc104 signals are ISA compatible and easy for amateurs to make simple boards.
I could try to reproduce the bus signals as far as possible, but make no guarantees.

PC104 is still widely used in industry because it is easy to make boards and industrial applications often don't need PCI performance.

It would allow you access to boards like this:
http://www.arcom.com/products/icp/pc104/modules/AIMcom8.htm
for instance if you wanted eight serial ports.

> PCI bridge

If it needs to sit in a PC, one might as well run a software emulator.

> Network

With the internet, or just other XLs for multiplayer gaming?

It's a silicon chip with an array of programmable logic.

You write a high level logic description,
which is compiled into a low-level logic description,
and a fitter fits that into whatever brand of FPGA you have.

Essentially, you design your own silicon chip.

3898. Kickman for Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-21 01:12:34 UTC
From: bill@newbreedsoftware.com
Message-ID: <6YRnd.6482$_3.82959@typhoon.sonic.net>

Was there ever a port of the arcade game (which I saw on my brother's C=64) "Kickman" for the Atari 8-bit?

I see there's a 2600 one (either done, or in progress), but can't find any info on an 8-bit one.

Were there any suitable clones? ;)

Edward S. Baiz Jr. <edbaizjr@comcast.net> wrote:
> What drivers exit that the Atari 8-bit can make use of?

Currently there's USB keyboard, USB steering wheel, and USB analog joystick support.

Sadly, the keyboard I have didn't work 100% (it's a keyboard with a built-in trakball, so perhaps that was the problem). The steering wheel I borrowed didn't seem to work (it was some Microsoft brand). And I don't have a USB joystick.

Personally, the steering wheel seems the most interesting of them, so far. (Since I already have digital joysticks, a trakball and the Atari has a built-in keyboard, of course.)

Drivers I'd like to see include: CF memory card reader, USB ethernet and maybe USB printers (though that's not too important since I don't print from my Atari much, and if I really needed to, I could probably just use my SIO2PC cable!)

:)

OMG, why would I want to go there? Last time I was there, Universal Studios LITERALLY (no joke) just kept admitting people until I was actually walking shoulder to shoulder just to try and leave. There wasn't a single inch of space to decently walk in.

It just isn't the same anymore.

Hi Kryten,

Do you need a Verilog model of the PIA chip? I had started writing Verilog models of each chip within an Atari 8-bit computer back in 2003. The PIA is one of few chip models I had time to finish before other projects took over. (Of course this is the 2nd easiest to Freddie... I have that model too as well as the CO61618 XL MMU and C025953 XE MMU). I have part of the ANTIC chip, but it is not complete. My ultimate goal was to get these models into an FPGA. It looks like you are further along...

Please write me at cmartin@ti.com, if you would like any of these models, or need help writing others... or need help testing (I have access to many FPGA boards and even a Quickturn emulator for debug).

BTW, I like the idea of calling your FPGA computer a Polymorph... blatant Red Dwarf reference. :)

Cheers,
Chris

Oh good. Last I remember you were having troubles. How did you get the computer fixed?

And the setup you mentioned sounds quite cool. You have Ice-T on the Atari side for the terminal, what program are you using on the win server?

Over here I finally have the 800 setup the way I used to.

For one, the 800 is running Bobterm, not great for terminal emulation, but great for macros. On the 800 Ice-T seems the best for ANSI and 80 column, but it doesn't have macros. And I get tired of manually entering numbers, URL's, passwords, etc. Sooo...

... I used the laplink trick. I have the modem, Atari 800, and a laptop PC connected by a blue laplink cable. I type on the 800, the laptop picks it up in its own program (which I am using Ripterm I believe). And viola! I have a setup where the 800 can do the driving, and a screen that displays color ANSI and Ripterm (though getting around in Ripterm can be fun at times.) :)

So I wish a more native solution for the 800 was possible, but when I think about it, the XEP80, ATR8000, 1090 XL, Black Box.... all these were computers in their own right to assist the Atari 8 in doing something. So don't feel so bad. :)

Ken,

The USB controller is the Cypress SL811HS Host/Slave Controller. The
circuit is designed by ABBUC members but I believe the data registers for
the chip can be accessed in the D5xx range.

You can get a datasheet for the chip with the complete register
description and application notes here:

http://www.cypress.com/products/datasheet.cfm?partnum=SL811HS

3918. High density floppies

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-22 23:04:14 UTC

FamilyNet Newsgate

Here is a basic question about floppy disks.

There are single density, double density, and then there was the later
standards, like high density. Disks that the IBM was able to squeeze
1.44 meg, 2.6 meg, and so forth out of.

Short of converting my XF551 into a IBM floppy drive, are these disks
in any way able to be formatted into Atari format?

Thanks!

I'm working in VHDL. I heard it was strongly typed, which many people dislike but I find that if you give people lax rules they can get away with sloppy coding. I ought to learn Verilog too, but don't have the time...

I/O chips and multiplexers are easy enough as you say, and if I use someone else's code I can't sell it on without permission/royalties etc.

Any non-easy code is hard work to fathom (for me anyway).

I have a late model XL with Freddie and no GALs.

> I have part of the ANTIC chip, but it is not complete.
> My ultimate goal was to get these models into an FPGA.
> It looks like you are further along...

Still a long way to go!

My current display controller has 800XL compatible basic video/CPU cycle timings.
I'm using a 512K SRAM because they can run faster than DRAM, and they have no refresh demands.
That should be plenty for old software! And it could be battery-backed too.
However, a cost engineered design might use DRAM to reduce pin count and price.

> I have access to many FPGA boards and even a Quickturn emulator for debug.

Which ones have you got? I use a BurchEd B5.
I think a PC104 based board might be good, as the bussed pins are fixed.
I can also use one source to drive the CPU and 14.318 MHz bus clock.

When I get it working, I'll need a few Atari experts to look for faults.

> BTW, I like the idea of calling your FPGA computer a Polymorph... blatant
> Red Dwarf reference. :)

Absolutely. Though the trades description act might argue that 'poly' means 'many', and it can only do one platform at the moment. The Tandy CoCo would have been an easier next target but doesn't have such a large software base (though OS/9 might be rather cool). I have a 6809E in DIP40, but would prefer a 63C09E in PLC44 to save space.

The Atari 8-bitters never had Elite, which would have been a killer app.
Perhaps when I get the hardware done I could port the C source code to it.

Cheers, K.

Hello Ken,

all info is on the MicroUSB Website, http://www.microusb.org. The driver SDK is in FORTH, because FORTH is really good in rapid prototyping new USB drivers. Once we know how the driver must work, we translate the FORTH code into Assembler. Using the USB Cart is very easy. In short, the SL811HS has 256 byte internal memory, where the first bytes are the internal registers.

To access the USB Controller, there are two Memory locations in the Atari

USBSEL = $D500
USBDTA = $D501

In USBSEL you write the number of the USB Chip Register to address, and in USBDTA your then read or write the value. The addressing scheme uses auto-increment, that is each read and write to USBDTA will increment USBSEL.

You can even programm the chip in Basic. Here is a short example to read and print all 256 Registers:
(TurboBasic)

```
10 USBSEL = $D500
20 USBDTA = $D501
30 POKE USBSEL,0
40 FOR I = 0 TO 256
50 ? Peek(USBDTA)
60 NEXT I
70 END
```

Because USB is not time critical, protoyping of Drivers can also be done in Basic or any other programming language.

Best regards

Carsten Strotmann

> don't have a USB joystick.

Some USB devices like Keyboards and Wheels technically seems to have more
than one USB device build in, in the case of Bills Keyboard a trackball.
These USB devices are than attached to an build-in USB hub, and the HUB
will be connected to the HOst (tha PC or Atari). Because we don't have any
driver for USB Hubs today, this kind of devices will not work. As a rule
of thumb, all devices that allow other USB devices to be attached to it
must have an USB Hub, and there is no support today.

USB Hub support is possible in the USB Cart, but Hubs are complicated and
a driver will be big (10-30 K vs 200 byte for Keyboard).

Hi,

> Short of converting my XF551 into a IBM floppy drive, are these disks
> in any way able to be formatted into Atari format?

Not really. That is, you can format it, you can write data onto them,
but don't be surprised if the data is gone the next day. The problem
with HD disks is that they require a larger magnetic field to get
permanently magnetized (that is, they are "magnetically harder"), and
especially a larger field than the SD/DD heads can offer. The result
is that a) if you're lucky, you can format and write data to them,
but b) it doesn't stay there for a long time.

So long,
Thomas

> Short of converting my XF551 into a IBM floppy drive, are these disks in any way able to be formatted into Atari format? <

If you look at the proerties/specs of 3.5" media versus 5-1/4", you'll find that the 3.5" DD and HD disks are much closer together than the 5-1/4".

It's still not recommended, but I've had no trouble with 3-1/2" disks formatted both ways. What I've found is that if I have no trouble formatting, then I have had no problems. Due to the blends of magnetic materials and other factors some disk are undoubtedly more "compatible" than others. And writing out DD is an easier proposition than HD.

Best advice: if you want to be sure, use good disks of the proper density.

-Larry

I used to code in VHDL, but I found that it takes me thrice as long as coding in Verilog. VHDL is great for projects where large numbers of coders are involved... they are forced to code the same way. Verilog is great for small one-person hobby projects. But, it is really just preference.

If you use a big enough FPGA you can emulate the SRAM within the FPGA core. I am not sure if this is cost effective or not, but since the Atari 8bit only needs 64k I would think this would be okay. For that matter, I would put the ROM inside the FPGA as well.

Coding is labour intensive, so re-cycling and understandability is my main
concern.

> Verilog is great for small one-person hobby projects.

I know people who have coded an ARM-beating micro for mobile phones.
All in verilog. I think ARM use verilog too.

> If you use a big enough FPGA you can emulate the SRAM within the FPGA
> core.
> I am not sure if this is cost effective

It isn't. ROM/RAM chips are made in far bigger numbers, and on my FPGA I
only have about 8Kbytes to play with. Best to reserve it for stuff that
really has to be on-chip.

> put the ROM inside the FPGA as well.

I use Flash ROM, and the FPGA just uses ordinary RAM process (hence it can
be cheaper than non-vol variants). Again, cheaper off-chip.

The CPU is also available, so I have kept that off chip for now.

Hi all!

Well, I've tried the interface. I have run into some problems. After
checking the sectors on drive and partitioning the disk, i could not
format any of the partitions I created. If I tried to format the
partition, I would get an error '160'. I'm not sure what I did wrong.

Hi all!

Please format hard disk using MyDOS with option <drivenumber>/N , f.e. if this is D1: partition, please use 1/N. Formatting option doesn't work inside FDISK, you must use DOS. I hope you changed drive settings to High Capacity? (Option O in MyDOS)?

Please check if there is a little delay after turning on the Atari. It should be about 5 or more secs. of delay. If Atari starts immediately (as usual) - it may be timing problem. In such situation it might be necessary to decrease/increase capacitor value inside interface.
Rory, please contact me directly, I'll try to help you!

Jurek.

May I suggest computerclassics.com, classiccomputers.com, or something
similar instead? :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> - Ramcart 256k by ??? (Poland or Czech Republic)

RAM-Cart 64k and RAM-Cart 128k were released by the -Polish- publisher
L.K. Avalon. RAM-Cart 256kB (called Double RAM-Cart), RAM-Cart 512kB
and RAM-Cart 1MB were done by Zenon/Dial (Zenon Rakoczy) from Poland,
too... :)

3944. Searching for cartridge ROM dumps

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-25 11:37:10 UTC
From: Matthias Reichl <usenet-200411@hias.horus.com>
Message-ID: <slrncqbgv6.1i0.usenet-200411@camel.hias.horus.com>
Source record: 13751

Where can I download ROM dumps of Atari cartridges?

I already found several dumps at Atarimania and a few other images
at some other sites but I'm still looking for more.

The reason: I'm currently working on finishing the remake of the
TurboFreezer XL and need these dumps of testing.

Compared to the original version of the TurboFreezer by Bernhard Engl
my remake contains a flash ROM and a larger RAM chip (currently 128k
flash and 32k RAM, the final version will have 512k flash and 128k RAM)
which can be used to emulate Atari cartridges.

Four cartridge types are supported: 8k/16k standard carts ($A000-$BFFF/
$8000-$BFFF) and OSS and SpartaDosX bank switching carts. The cart data
can either be stored in the flash ROM or in the RAM on the freezer
(latter is practical to develop new carts).

But: some carts (especially bankswitching carts) need to be patched to
run with the Freezer because the Freezer, which connects to the PBI,
can't signal if a cart is present. This is no problem unless the cart
manually sets $03FA (the shadow register of $D013). If $03FA doesn't
match the value of $D013, the Atari will lock up. So references to
$03FA need to be patched out.

I already analyzed some carts: BasicXE (V4.1) and SpartaDosX (versions
4.19, 4.21 and 4.22) need to be patched, the versions of Mac65, BasicXL
and Action I've got don't seem to be affected.

I also wrote a small patcher program to do this automatically, so there
will be no need to re-distribute patched dumps.

When I've got more dumps I'll try to analyze them and extend the patcher
program. Maybe it is also possible to get more/different cart types
working by patching the bank-select code to either match OSS type
($D500/01/08/09) or SDX type ($D5E0-EF).

so long,

Hias

Jurek & all,

Things are running smoother now...

Ahh. ok, I got the drives to format using the /N switch. Yes, I changed all the drives to 65534 sectors and it works great. I'm now trying to get it to boot from D1:

You may want to put the Drive /N hint in the docs.

Also, make sure you put the card in straight. There is a cartridge wedge on the cartridge side of the computer to help open the old carts (400/800) and not a wedge on the expansion side. This may cause the interface to be off center. Either remove the wedge or modify the ide adapter case.

Rory

Wow.. Talk about nostalgia.. I just came across an old hard drive with the entire contents of my old "Atari Connection BBS" from 1996 - complete with all the message bases, online games and user accounts just as they existed in 1996.

If I could figure out how to get this old Pro! BBS online (via telnet/ssh), I'd do so.

If for no other reason, the BBS has a ton of 8bit files still there.

Uhm. Jim. Can you fix those XLs? And if you fried them, you gotta make
sure you know what is doing it. Probably something to do with power supply
for XL or MUX? We can't be losing XLs like this. But, probably ebaY is one
place to get XLs.
There are vendors of course, which you know who is, like Lance Ringquist at
Video 61. Bob Klass also might have some to sell you. You know who the
vendors are.

3954. Re: High density floppies

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-26 21:33:39 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41A7A133.49C79641@students.uni-mainz.de>
Source record: 13761

Well,
you can easily turn your XF551 into an Atari compatible 3,5" (720k)
drive. But it will not do HD, since the XF controller (the same as in
the ST floppy drives) can only do DD. I think later ST floppy drives
used a chip called "Ajax" to do HD, maybe this chip would also be
usefull for a XF drive to do HD...

On the other hand, HD floppies or disks are not really nescessary for
Atari 8bit computers, if you need more than 720kbytes, why not use a
harddisk ?!? I did use the following simple solution:

1) turned my XF into a 720k 3,5" drive,
2) used a HD 3,5" drive and set the jumpers to DD,
3) used HD disks and put a write protect notch (from the good old 5,25"
disks) on the HD hole, so the floppy drive could not detect it as being
HD...

Since the drive mechanic was a HD drive it could easily format the HD
disks in any Atari compatible SD and DD format. And up to date (more
than 5 years!) I have not lost any data on these HD 3,5" disks that are
formatted in Atari SD or DD format... -andreas.

P.S.: Alas, not every 3,5" HD drive can be jumpered to be used as drive
0 (zero) or as a DD drive... you have to test this...

3955. Re: Ramdisk Overview...

Yeah, I know what fried one of my primary 256k XL's.. It was me. I hooked
everything up inside a mid-tower PC case and created a power cable from
the +5 on the PC switching supply. Unfortunatly, when I wired the
connector, I reversed + and - and it fried the XL.

I just tried to fix my 576k XE a few minutes ago and I appear to have made
it worse.

I'm now down to one 256k XL, with 3 fried XL's and my deteriorating XE.
I've sent email to Bob Puff to see if he's willing to look at / repair.

Regarding Bob Klaas. Is he still around? If so, does he still live in
Utah? I lost contact with him about 5 years or so ago, even though he
lived a mere 5 miles from me.

Hey, Jim. I don't know about Bob Klaas. I was hoping you knew something.
Haven't seen him here in csa8 for a long time, or Lance either. Hope both
are well. Seems like Bob was having domestic problems, maybe his wife was
telling him to clean out some of his stuff. Lance still owns BBS Express
Pro I think.

Since I deal with more than computers, that wouldn't work either, and an .org is supposed to be for a non-profit organization, not commercial (.com). I don't like when sites start using the wrong type at the end.

Anyway, the reason I selected 8bitclassics is because that is what I know, and that is what I am focusing on, but I will be adding newer systems as time goes on. Thinking of it, I only have some Atari ST software online, but that is about it for 16-Bit.

As for the TI, I thought the 4A was 8-Bit? At least externally, maybe internally it was a hybrid 16-Bit system?

The TI was the first commercially available 16-bit to the consumer.
The 9900 is a 16-bit microprocessor, with separate address and data
bus. 16-bit address bus (MSB is used to determine even or odd byte)
allowing it to address 64k, byte addressable. 16-bit data bus. In the
99/4A, this is muxed to an 8-bit data bus outside the console for use
with 8-bit peripherals (not unlike the first PCs - in this case more
like an 8086 than an 8088 which was 8-bit at the processor
connection.)

The instruction set has 16-bit registers and hardware multiply/divide
(unsigned).

From: JR <"jr256_69\\@NO$PAMhotmail.com">
Message-ID: <Tk3qd.402797$wV.234301@attbi_s54>
Source record: 13777

I've been trying off and on, for a couple of years, to get the CP/M bootdisks for the SWP ATR8000. I have the Teledisk images from the late Don Maslin's archive, but no one I know of, including Don, was ever able to successfully recreate the CP/M disks from those images. I have tried, but no combination of hardware I have has been able to successfully recreate track 1 on the disk. Everything else on the disks is readable, but without the data from track 1 the disks just won't boot the system.

So if anyone out there has these disks, I would be willing to pay any reasonable costs involved to get copies.

Hello Fellow Vintage Computer Enthusiasts,

Please forgive the intrusion but I would like to make you all aware of the existence of the Vintage Computer Forum at www.vintage-computer.com/vcforum.

With nearly 600 users and a wide variety of moderated topic areas these forums have quickly become a valuable resource for the vintage computing community on the web.

Signing up is easy and safe and requires only an email address (which will be used only by the forums and which will never be disseminated.)

Whatever interests you it's likely you'll find someone else with similar interests. If for some reason you don't, please don't hesitate to recommend a new discussion area. Several have been added recently based on just these types of requests.

We look forward to your visit!

Please note, I'm well aware that not everyone on Usenet likes web forums. Such is life. Please don't visit if you don't think the forums will be of interest to you. I am simply offering a free service to the vintage computer community and I'm trying to get the word out. I like to think of the forums as a compliment to Usenet and mail lists. Forum bashing is fine, but we've been there before. . . ;-)

Unless the images are from 8" disks, it should be simple to recreate the
disks using standard PC hardware. You need a 5.25 drive of course. Just
make sure you are using DD disks (you probably have some if you are in
this group :) and NOT HD ones.

What exactly is the problem when you try to write the images back to disk?
What hardware/software you were using? What you mean by track 1 not being
readable?

3981. Atari 8-Bit Computers: Vendors and Developers

Newsgroup: comp.sys.atari.8bit

UPDATES SINCE PREVIOUS POSTING
2004.11.15 Steven Tucker, AtariMax/ABBUC USB Cartridge
2004.11.15 HiassofT (Matthias Reichl), MyPicoDos V4.02
2004.11.14 Telegames entry deleted, dropped classic support Sept. 2004
2004.11.14 Video 61 & Atari Sales new title: Jinx
2004.11.03 Bravo Sierra Computers, URL correction (thanks Ben)
2004.10.30 HiassofT (Matthias Reichl), MyPicoDos V4.01
2004.10.20 Marius Diepenhorst, SpartaDOS for MyIDE
2004.10.20 Shawn Jefferson, MyIDE Image Manager 1.2
2004.10.20 Lee Barnes, MyDOS RAMdisk patches, Black Box ATASPI V0.42 and .41
2004.10.20 Matthias Belitz, Black Box ATASPI V0.40, ATASPI CDPLAY V0.20,
ATASPI MON V0.12; and msc-IDE utilities listed
2004.10.20 Mathy van Nisselroy, CD Audio Player 1.47, CD/DVD Data Reader 0.67
2004.10.09 Radek Sterba, Raster Music Tracker 1.17, Atari RMT Player 1.04
```

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they

are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Subject: A

4JAYS (Jay Colen) 9/04
519 W 4th St
Antioch CA 94509-1246
USA
Shop Phone: 925-777-1160
Store Hours: Tuesday thru Friday 12-6pm - Saturday 11-5pm
http://www.4jays.com/
Vendor: new and used hardware and commercial software

8-Bit Classics (Corey Koltz) 8/04
Stevens Point WI
USA
http://www.8bitclassics.com/
Vendor: hardware and software

A-ONE Magazine - Atari Online News, Etc. 9/02
Dana P. Jacobson -- Editor
USA
http://www.AtariNews.org/
Publisher: A-ONE online magazine. weekly

Advantage Web Solutions & Computer Services (Jim Mason) 7/04
PO Box 561
Mason City IA 50402-0561
USA
http://www.jamess.com/
Developer: The Atari Weather Station -- build your own dedicated temperature monitoring station using simple thermisters and the provided software. Also available: source code listing, temperature data aggregation utility

Alhart Enterprises Presents (AEP) 9/02
c/o Paul V. Alhart

524 North Zee St.
Lompoc CA 93436
USA
tel: (805) 736-4624
Vendor: used hardware--mainly reconditioned disk drives: 810 (no case),
810 w/case, 810 w/Archiver, 1050, Rana 1000, 1050 w/doubler, Indus GT
Developer: AtariWriter+ Companion (disk), AtariWriter+ Companion II (disk),
StarStuffer (disk), Search System II (disk), Atari BASIC Enhancements (disk),
8-bit TTL Logic Analyzer (disk), MagicCalc (disk), Games disk:
Jacks Cargoship + Light Pen/(Light Gun) Tic-Tac-Toe (disk).
Publisher: RANA Repair Guide (book) - US$12

Altronic E.I.R.L. 6/04
Bolognesi 952
Bellavista
Callao 2
Peru
tel: (51)(1) 429-4298
Repair Shop.

Alltronics - Electronic Component Supply 5/02
PO BOX 730
Morgan Hill, CA 95038-0730
USA
Phone: 408.847.0033 Hours 10am to 4pm Monday - Friday
Fax: 408.847.0133
http://www.alltronics.com/computer_miscellaneous.htm
Vendor: 1020 Color Printer, CX85 Numerical Keypad, CX80 Trak-Ball
Controller, ALPS/1020 printer/plotter pens

AtariAge (Albert Yarusso, Alex Bilstein) 3/04
See also: Pixels Past
http://www.atariage.com/
Vendor: new hardware, commercial software

Atari Bit Byter User Club e.V. (ABBUC) 11/02
c/o Wolfgang Burger
Wieschenbeck 45
D-45699 Herten
Germany
Tel./Fax +49 2366 39623
http://www.abbuc.de/
Vendor: PD/freeware/shareware, hardware, commercial software
Developer: wide variety including: SIO2PC(SIO2ST)-Interface,
PC-Xformer Cable, Automatic 2-Computer Interface, Switching Power Supply
(SPS), 8-Channel dig. Voltmeter (DVM), XL Switching Interface,
Speedy 1050 upgrade, RomDisk, QMEG+ 4.0.
Extensive hardware schematics for sale.
Has obtained rights to many products including: KE-Soft, Klaus Peters
Elektronik, AMC-Verlag, Compyshop
Publisher: ABBUC Magazin (disk mag), ABBUC Sondermagazin (print mag)

Repair Shop.

The Atari Times (Gregory George) 2/04
USA
http://www.ataritimes.com/
Publisher: The Atari Times online newsletter,
The Atari Times Compendium (paper book, published annually)

ATARIX (paper magazine) 8/02
See: Satantronic

AV Toolbox 1/04
USA
Phone 800-235-3280 or 859-647-1077
Fax 859-282-8225
http://www.avtoolbox.com/
Developer: a number of composite video<->VGA conversion devices,
including the Cheese Video Box. Connect your Atari to your PC monitor!

Subject: B

B&C ComputerVisions/Atari Sales & Service (Bruce & Cathy Carso) 9/02
5917 Stope Way
El Dorado CA 95623-4716
USA
tel: (530) 295-9270 11:00 AM to 4:00 PM Monday to Friday (Pacific Time)
FAX: (530) 295-9271
http://www.myatari.com/
Vendor: new/used hardware, commercial/PD/freeware/shareware

Eric Bacher 9/02
France
http://ourworld.compuserve.com/homepages/ebacher/
Developer: DIS6502 1.4 -- Atari 6502 Disassembler for Win 3.1/95

Richard Bannister 1/04
See also: Chris Lam
Dublin
Ireland
http://www.bannister.org/
Developer: Rainbow v1.5.0 - port of Rainbow 1.4 (Atari 800 series emulator
for MacOS 9) to Mac OS X, Emulator Enhancer v1.4.1

Lee Barnes 10/04
http://www.mathyvannisselroy.nl/mydos.htm
http://www.mathyvannisselroy.nl/aspi.htm
Developer: MyDOS RAMdisk patches, Black Box ATASPI V0.42 ("Atari (Advanced)
SCSI Programming Interface"), Black Box ATASPI V0.41

Ullrich von Bassewitz 5/04
Germany

http://www.cc65.org/
Developer: cc65 2.10.1 - a complete cross development package for 65(C)02
systems, including a macro assembler, a C compiler, linker, librarian and
several other tools.

Michael Beck 5/03
Germany
http://www.rho-sigma.de/
Developer: Atari 8bit filesystem for Linux 0.1

Matthias Belitz ("msc") 10/04
http://www.birmanns.de/atari/
http://www.mathyvannisselroy.nl/aspi.htm
Developer: msc-IDE Controller (IDE interface for PBI/ECI -- sold out),
IDE software utilities: INSTALL.COM V1.03, SETUP.COM V1.13, FDISK.COM V1.10,
MAP.COM V1.10, HDINST.COM V1.00, LMAP.OBJ V1.03, CDPLAY.COM V1.0,
CDREAD.COM V1.4, IMG2DISK.COM V1.00.
Black Box ATASPI V0.40 ("Atari (Advanced) SCSI Programming Interface"),
ATASPI CDPLAY V0.20 (audio CD player), ATASPI MON V0.12 (SCSI monitor)

Bensley Consulting (Brett Bensley) 1/04
PO Box 301
Westfield IL 62474-0301
USA
tel: (217) 967-5465
Developer: Happy's Programs - Math, U.S. History, Astronauts, Triangles

Best Electronics (Brad Koda) 9/02
672 Commercial St
San Jose CA 95112-1406
USA
Telephone: 408-278-1070 (M-F 1:30pm to 5:00pm PST)
FAX 408-278-1092
http://www.best-electronics-ca.com/
Vendor: new hardware, commercial software
Developer: "XE" Touch, Best Joystick, Best Light Gun.

BeWeSoft (Jiri Bernasek - Bernasek-Werner Software) 8/02
Na Hrebenkach 42
15000 Praha
Czech Republic
Developer: BW-DOS 1.00/1.10/1.30, BW-DOS Update #2, Multi Dash, Multi Race,
Multi Worms (multiplayer-games for multilink/gamelink 2 hardware), Golfer,
H2O, Tetris 3D, Superpacker 1.0, Virus Scanner 1.0, Text Converter,
plus many other game and demo programs...

Adam Bienias 8/02
Poland
http://www.try2emu.cavern.com.pl/sap/
Developer: SAP -- Slight's Atari Player, Codecruncher 2.x and 3.x

B.G. Micro 4/02
555 N. 5th St Suite 125
Garland, TX 75040
USA
orders: 1-800-276-2206 or 972-205-9447
tech: 972-205-9427
fax: 972-205-9417
http://www.bgmicro.com/
Vendor: CX85 Keypad,
hard-to-find chips for Atari disk drives (per Russ Gilbert)

Big Five Software (Bill Hogue, Jeff Konyu, Curtis Mikolyski) 9/02
USA
http://www.bigfivesoftware.com/
Developer: Miner 2049er, Bounty Bob Strikes Back,
Bounty Bob Emulator for Windows NT, 2000, 98, and ME

Bravo Sierra Computers (BSC) (Ben Smith) 11/04
Oregon
USA
tel: (503) 256-9974 "Ben's Benevolent Help HotLine" 24 hours
http://BenSells.Atari.org or http://BensCatalogs.Atari.org or
http://www.aracnet.com/~atari/
Vendor: used/new Games/Software, Hardware/Accessories, Books/References

Zdenik Burian 4/04
Marie Majerove 33
Prostijov 6
798 11
Czech Republic
http://flop.atari.org/
Publisher: FLOP disk magazine (Magazine FLOP is only in Czech.), annual

Artur Burzynski (j131) 9/02
Gdynia
Poland
http://strony.wp.pl/wp/j131atari/
Developer: SIO2PC cables

Subject: C

Sidney Cadot 10/02
The Netherlands
http://ch.twi.tudelft.nl/~sidney/atari/
Developer: ROMCRC-32 revision 1.0.2, Atari XL/XE Reverse Engineered
Annotated ROM Listing, SID-LOAD 1.0.5, BINTRIM 1.0.1

James Catalano / Classic 8-Bit Atari / Artacyis Software 11/02
USA
http://www.geocities.com/TimesSquare/Arcade/8691/
Developer: Axe Dreadroom, Death Quest, Darkrealm Keep, Terror Below,
Anteater, Buried Treasure Hidden Death, Camp Killemoff, Chivalry,

Cliff Climber, Code Red Rescue, Defend the Donut, G-Man 1920, Graveyard,
Gun Slinger, Hopper, Incoming!, Monster From the Deep, Orccon, Pengy's Arctic
Adventure, Pin Pong, Seagull, Skulls, Snakepit, Spellbreaker, Splashdown,
Bioroid Battle, Knights of Battle, Line of Fire, Mine Sweeper, Sea Strike,
Sub Hunt, Rally XL, Swamp Rider, Turbo Trek, Airlord, Canyon Run, Tail Gunner,
Aliens: Genocide, Aliens, Search for Newt, Computer Virus, Lunar Miner,

3D Tic Tac Toe, Blackjack, Catapult, Champion Greyhound Racing, Demonix:
Battle of Souls, Gennetixx, Knock Out!, Particles, Ripley's Believe It Or Not,
Psybercom, Saucerian, Saucerian II, Shuttle Run, Star Rider, Starlord 5,
Stellar Rescue, Teleport

ChildsPlay Software Services (Larry Serflaten) 1/04
9127 State Highway 25 NE Apt E
Monticello MN 55362-9148
USA
Developer: Bumpers!, Concentration, Lights Out, MahJong, Solitaire,
Video Slots (all published by Video 61)

Computer Games Plus 3/04
PO Box 6144
Orange CA 92863-6144
USA
tel: (714) 639-8189
http://www.gamesplus.com/
Vendor: commercial software, plus a few power supplies

Computer Software Services (CSS) (Bob Puff) 4/03
1350 Buffalo Rd. #2
Rochester NY 14642
USA
tel: (585) 429-5639
Fax: (585) 247-7158
http://www.nleaudio.com/css/
Vendor: hard drive systems, SIO cables, hard disk controllers
Developer: Black Box, Black Box with 64K Printer Buffer, Black Box Printer
Cable, Black Box Modem Cable, Floppy board, Super-E Burner,
Gang Super-E Burner, Multiplexer, Multiplexer Slave Unit, Quintopus,
Quintopus with Switchable Ports, Super Archiver, Super Archiver II,
Super Archiver --> SA II Upgrade, XF Single Drive Upgrade,
XF Single Drive Upgrade (without Drive Mech),
XF Dual Drive Upgrade, XL Dual Drive Upgrade (without Drive Mech),
XF551 Enhancer, XF Update, Ultra Speed Plus OS, Hard Drive Pro Backup,
Super Pill, Disk Cracker, Black Patch
Shareware developer: SuperUnArc 2.4, SuperArc 2.4, Disk Communicator 3.2,
MYDOS 4.50, BobTerm 1.21, MYDOS WHEREIS, MYDOS VTOC FIX
Repair Shop.

Subject: D

D'Antiques, Ltd. (Dan Dotson and Marilyn Saul) 11/02
PO Box 40751
Tucson, AZ 85717-0751
USA
FAX: (561) 658-0835
http://www.dantiques.com/
Vendor: used hardware and software

Jan Detlev 11/02
The Netherlands
http://www.detlev.myweb.nl/ or http://home.wanadoo.nl/jdetlev/
Vendor: new hardware and software

DGS 11/03
See: Dean Garraghty

Marius Diepenhorst 10/04
http://www.mr-atari.com/hardware-3rd.htm
Developer: "SpartaDOS for MyIDE"

Digital Force (Mario Trams) 11/02
Germany
http://www.tu-chemnitz.de/~mtr
ftp://ftp.tu-chemnitz.de/pub/Local/informatik/trams

>
>
The images were created with a program called Teledisk. For the most
part the images are standard 40 Track CP/M disks (10 Sectors/track 512
bytes/sector). The non boot images work fine and create readable disks.
Even the boot disks are readable, only the boot sectors (on tracks 0
and 1) are a problem. The boot disks seem to have a different format
for tracks 0 and 1. Most of the controllers I have tried could not
create either of those tracks. I found one controller that was able to
reliably create track 0 and when looking at the track with Anadisk, it
has 11 sectors. Sector 0 is 128 bytes (like Atari DD disks) and the
next 10 are 512 bytes. None of the controllers could create track 1.
It almost always creates 5 Sectors of 512 bytes, all odd numbered. The
even numbered sectors do not get written even though Teledisk tries to
write them.

So either the images are bad, or the hardware/software that was used is
just not capable of recreating the non standard format of those 2
tracks. I know the ATR itself is capable of copying the boot disks, so
I'm hoping to find someone who has one with boot disks to make copies.
I also have a Copy II PC Option board which I'm sure could copy the
physical disks if I could find someone who would let me borrow the disks.

I didn't know that CP-M disks can have mixed sectors size, but that doesn't represent a hardware problem in a PC. The standard PC controller can format and write 128 byte sectors mixed with 512 byte sectors. You'll have a minor software problem though, the software your are using must be able to handle those sizes (which needs direct access to the FDC, can't be done through BIOS).

The Option Board can certainly copy those disks, but it is not needed. Any PC software copier should be fine for the job, no special hardware is required. But unless you are going to write the software yourself, you need to convert your images to a format that those copies could understand. I know that the image format for the Option Board is described somewhere in the net.

The main problem in the PC is however the drive and the target disk. As said, you of course need to use DD disks. But the drive is a problem as well. Ideally you should use a 40 tracks drive, not an 80 tracks one. It doesn't matter if the drive is HD or not, what it matters is if it's 40 or 80 tracks (but virtually any 80 tracks drive is HD).

If you can't find an old XT 360k drive, then you need to use virgin DD disks. Note that virgin preformatted disks are not good, and reformatting/erasing old disks is not good enough neither. They have to be virgin unformatted as they come from the manufacturer. There is no way to bring old disks back to the virgin format unless you have access to special very expensive equipment.

Non PC hardware can be used as well. For example, an Atari ST with a 5.25
drive, a 1050 Happy drive (but this would require custom software), etc.
It is mostly a software issue.

3987. ABBUC Software Contest 2005...

Newsgroup: comp.sys.atari.8bit
Date: 2004-11-29 15:11:08 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41AB3C0C.12D512BF@students.uni-mainz.de>
Source record: 13792

Hello Folks,
ABBUC decided to do another software contest 2005. To take part at this contest you may simply a) register at the ABBUC homepage (=> contest 2005, => register, then type in authors name and name+type of program, thats it) or b) send me your program(s) and/or some details about it, so I can register it for you. Send your programs to: software at . abbuc de For more information, please read the official contest rules below... greetings, Andreas.

Rules for the ABBUC-Software-Contest 2005:

1) General Rules:

The Deadline for the software-contest has been set to 31.August 2005 (until midnight). ABBUC will therefore spend the following Prices:
1st Place: 500 Euro
2nd Place: 250 Euro
3rd Place: 125 Euro
4th Place: 75 Euro
5th Place: 50 Euro
For all registered contest programs, ABBUC will get the right to release them on its magazine, while the Copyright will still remain by the author, who can use his program freely after the contest. The presentation of the programs will take place at the Unconventional fair in September and on the ABBUC magazines, whereas the decision and pricing will take place at the annual ABBUC meeting in October. There is no need for the author to be present at any of these events, the price will still be send to the author's postal adress or his bank account, provided that ABBUC has these adresses...

2) Program Types & Size:

The software-contest programs must be one of the following program-types:
a) Game/s, b) Application/s (also Tools, Utilities, etc.) and c) Operating Systems (DOS). Not allowed are any kinds of demos or intros, also not allowed are any beta- or pre-versions (meaning the contest programs must be finished). For compatibility reasons one must make sure, that the programs work at least on Atari XL or XE computers, which means standard 64k or 128k machines. Additional or extra hardware can be supported, but it must not be a requirement to own this extra hardware to load the program. Believe it or not, the ABBUC Software Ressort, as well as all ABBUC members, will do a "Quality" and "Compatibility" check of all registered contest programs...

3) Format and Languages:

The contest programs can be send as 5,25" Atari disk(s) or as
ATR-image(s), but
they must use Single (90k) or Enhanced (130k) density. Furthermore, the
program must have a short documentation, this can be included in the
program (internally) or as a separate text-file (externally). It is
therefore important, that one uses german or at least english language
(and explains shortly how the program has to be loaded), so that
everyone can handle the program. All Atari 8Bit compatible languages are
allowed as programming languages, but all of them have to be compiled in
the end, so that one can load the program without having to own a
certain programming language. The only exceptions here are Atari Basic
and Turbo
Basic XL source listings, since every Atari user owns these languages.
Lastly one needn't supply any source-codes for the contest programs, the
finished loadable or executable program is enough...

Happy programming wishes the ABBUC Software Ressort !!
(CharlieChaplin / Andreas Magenheimer)

Hope to see your Atari 8Bit programs in the contest 2005...

3988. Who did Sparta DOS X cart. ?!?

Newsgroup: comp.sys.atari.8bit

Just to correct myself. A 1050, disregarding Happy or not, cannot of
course be used to create a double sided disk.

Alternatively, T O... Tits Out (for the lads)

For Americans friends, i refer to that collective bunch the live in what is called THE U S of A, and those that claim to speak the ENGLISH Language (US English that is)

Additionally, it's you American's that need delivering from Mr Bush, We on the other side of the big blue need delivering from the Americans

As it could be proved that the majority of the Americans voted george bush (that gormless one) back in of a second term (and if that was a close election, then the Ukranian farse, must have been even closer)

Ahhh, so much for modern democracy (thanks largely to the ancient greeks)

> know it has a tandom mech identical to the one on the 1050. Hope it helps.

Javier, the XF551 does not do High Density. It does Single(128) and Double(256) densities which is bytes per sector..
High Density is at least 512 bytes per sector. All of the rest defines formatting...single or double sided, 40 tracks, for A8 drives usually, or 77/80 tracks for 5.25" high capacity drives(which has attracted the name high density, though they aren't). Single or double sided, 80 track or 160 track for 3.5" drives. Add to this the three methods of double sided..1 then 2, 1 then 2 reversed, alternate 1/2. An indus drive should be able to read the first two dbl sided methods if it does double density right. Writing is problomatic on all three.

The easiest way to use 720K 3.5" drives on the A8 is 1)ATR8000, XF551 upgrade, and 3)Blackbox. They can be formatted using 256 byte sectors. Can not use hd media. Using 1.44 meg 3.5" is a lot of work. Requires adding an 16mHz clock. Better spent on a hard drive.

Lastly, using Ape, SIO2PC, etc is also a useful alternative. Not my choice-I like the real hardware.

Rick D.

The Connection between America and Atari (just incase some of you think that this is getting way too political) is that Atari was ORIGINALLY an American company/registered company, started up by Nolan Bushnell (an American from Utah I believe)... this was until the french (in the shape of infogrammes) managed to get their dirty digits on the much beloved Atari

Additionally i'm pretty sure that before he started 'living in a bottle' even your Mr Bush liked to play on his Atari (a closet Atari fan perhaps)

And before you Americans started falling in love with that JAP CRAP (Sega, Nintendo, Sony etc), wasn't America's premier Videogame company/product/brand called Atari

It's not that hard to make Atari (and other 8-bit) BBSs telnetable. You can
use one of a few freely available PC server programs that convert incoming
telnet connections to the PC through the serial port to the 8-bit in question
via a ngll modem cable.

There is also a standalone device from lantronics that connects to an RS-232
port and emulates a modem on a network.

Hi,

Our Christmas sale starts Today, The 1st of December 2004
(01/12/2004).
The sale lasts for 1 week only.(ending at midnight on the 8th of
December)

For the duration of the sale, everything in our store is reduced by
20%

Simply add the items you want to your basket and enter the word 'sale'
in the discount code box on the shipping address page of the checkout.
20% will automatically be discounted from your order.

Please feel free to email me if you have any problems entering the
discount code.

All orders are shipped within 1 day of the order, so any orders placed
during this period are guarenteed for Christmas delivery (worldwide)

Best Wishes + Merry Christmas
Mike

My solution (and one of these days I'll write it up somewhere) was to pick up a used portmaster terminal server from Ebay for $15. Now I've got 32 serial ports to hook up my older machines to (besides the XL, there is a MegaSTe, Apple IIgs, and Apple IIc+). When they connect it is set up to automatically telnet directly into my Linux box. The portmaster has a 10base-T ethernet port, and you can configure each port individually.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41AF665C.43F26CEB@students.uni-mainz.de>
Source record: 13870

Hello Shawn,
yes you are right - your MyIDE imager cannot take part in this contest,
since it requires extra hardware (the MyIDE). Allthough your program is
great for all those Atarians who own a MyIDE (like I do), it is pretty
useless for those that do not have this hardware. And err, ABBUC has 400
members, afaik less than 100 do have the MyIDE... I feel really sorry
about this - maybe this is a good point we should think over again at
the next ABBUC meeting... -Andreas.

The rule isn't a bad one though. It ensures that the entries are useful
for everyone. It's also difficult to score an entry like this. People
without a MyIDE upgrade would give it a bad score and the people with one,
would give it a good score.

I'm not upset that I can't enter it. Maybe I should program a game that
I've been mulling over in my head the last couple of months. :)

Bullshit.

Have you ever read the first amendment?

The First Amendment concerns GOVERNMENTAL efforts to control speech.
GOVERNMENTAL prior restraint.

The First Amendment has nothing to do with the crap spewed by Atari boy on
this forum and the efforts of private citizens such as the users pissed by
the never-ending spam to stop Atari boy from continuing to spam.

If you insist on playing a constitutional scholar in this forum, at least
take the time to read and understand what that portion of the Constitution
you cite to actually says.

From: Altus <siraltus@earthlink.net>
Message-ID: <2004120311595916807%siraltus@earthlinknet>
Source record: 13879

Hello all,

I just got a like-new Atari 1030 modem and now need the 1030 Express software. Does anyone have a disk image they could email me? I don't want to use the built-in ModemLink software.

Thanks!

You can find 1030exp.exe, which is what you're looking for, I think, at
ftp.spudster.org in the terminals directory.

It's me again.
Uhm. You can't do anything with that 1030, much, no ISP will connect at 300 baud. You can maybe setup something between the 1030 and another modem that you have, maybe. I guess I should ask, what are you going to do with that 1030?

I agree with that one whole heartedly. At the moment. Guess I am too lazy
to get a windows PC up and running at home, so I make do with the usual
methods of getting around on a Atari.

Uhh... I'm sorry, what is the big deal about America and Atari suddenly being brought up?

Americans have been on the internet for years, and in the Atari newsgroups since its inception. Notice I am stating this as a fact of "We are here along with everyone else" verses "We started the thing to begin with."

So yeh... Americans are on the internet. We've had many hands in Atari's history. And we are bringing this up why?

Your user group sounds really impressive, and Cybernoid almost has me
convinced I need to learn some German and join up. :)

Hey, question for you and the MyIde users... what terminal programs have
you been able to get working successfully?

Me so far, Bobterm. And terminal and BBS'ing is like 90% of what I do
on a Atari 800 these days. (love the typewriter feel of the Atari 800)

Any of your members that have the MyIde working with a 850 interface and
a terminal program other than Bobterm I want to hear about.

Thanks!

You know a cartidge port is a wonderful thing. Used for MyIde carts,
USB carts, Ram Carts... just a wonderful extension of the Atari computer
motherboard. For later computers they would be PCI slots, AGP ports,
etc etc... but we have a cartridge port.

And we have one. :)

Well, ok, the Atari 800 has 1.9 slots.

Soooo... anyone ever come up with a way to have more slots? A way of
bank switching, or something?

Source record: 13799

FamilyNet Newsgate

Oh yeh! That's right. Modem link! Forgot about that. How do you access
that again?

What on earth are you logging into at 300 buad with? I don't think the
local BBS's here in Dallas will even think of 300 buad these days, thus
the reason I have not used the 1030 and the m1000 (believe) the modem
that works through the cartridge port.

Sighhh... it is a catch 22... would love to work from my Atari 800 with
nothing but a 1030, a terminal cart, and the 800.. but then well...
aside from speed... the earlier term programs, even 1030 Express...
which I might have around here somewhere... really does blow for any
real usefulness.

Hmm.. you got me wanting to try this again. Hmmm... the fun of finding
that SPECIAL power supply for the 1030. :)

Ok, ladies and gentlement, I am now typing this at 300 buad! :)

Yeh, figured I would try it out to see if anyone would still connect,
and I found at least one BBS that will:

The Family-Net BBS
972-496-0650

What's even better, you can connect with the Atari computer to the
family net with the 300 buad modem, then telnet to current Atari BBS.

Just type "telnet" once you get into the Family-Net (and once given
access. If you have trouble let me know, I know the sysop well) and
then go to the following BBS's

Closer to Home: cth.dtdns.net
Boot Factory : bfbbs.dtdns.net

It really is a lot of fun to get on those BBS's, and we are managing new
traffic there daily.. been kinda picking up lately!

Get on the BBS's, write messages, watch break type movies... it is just
great.

And on Family-Net, they have Atari 8-bit, ST, Jaguar, and well, hundreds
of other newsgroups on there.

Anyway, really not a add.. just FYI.

And with that, I'm saving this and returning to 9600 buad. ;)

Yes, San Fran. From the web site http://www.abacusonline.org/ they look
active. And it looks like they publish a newsletter still. I was trying to
re-establish a newsletter exchange between them and SPACE. They're on our
mailing list, but we haven't been receiving newsletters from them.

As far as I know Tom Harker of ICD was one of the principle people involved in the development of the cartridge. But I don't know of who else was working within ICD on Spartados X. I seriously doubt Harker wrote Spartados X by himself.

I don't know if John Harris ever had any direct involvement with ICD. And John Hardie defintely did not develop Spartados X.

It is a good piece of work considering the code is relocatable. Too bad they didn't make the system files for drivers open source to allow people to develop their own drivers.

I think the rights to this and the other 8bit products (e.g. MIO, Basic XL/XE, Mac 65) are still owned by Mike Hohman of the former company called fTE.

FamilyNet Newsgate

Are you guys like the last 8-bit club in North America?

How is S.P.A.C.E. doing, and more importantly, what does it take to
join?

Doc Clu

> Yes, San Fran. From the web site http://www.abacusonline.org/ they look

Not sure but don't think anyone ever came up with additional cartridge
slots. There are however some stackable carts allowing for the use of
more than one cart at a time.

Just doing some casual surfing and type Atari 800 Ethernet in the google and came up with the few hits. All going back to a Chris guy that was developing a ethernet cartridge. The link no longer seems to work. Was wondering if anybody has/had any info on this?

-Chris

4051. USB Enduser Device Driver Disk

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-05 17:47:55 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2004.12.05.17.47.55.580847@strotmann.de>
Source record: 13808

Hi,

we have packed all USB drivers available today on one ATR Diskimage for
endusers to use:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartAtariDriverDisk

What is on the disk:

```
Filename Comment
-----------------------------------------------
DOS.SYS Atari Dos 2.5 FMS
DUP.SYS Atari Dos 2.5 DUP
BIBOASS.COM Bibo Assembler
USBKEY.SRC USB Simple Keyboard Driver Source
USBKEY.COM USB Simple Keyboard Driver
USBWHEEL.SRC USB Wheel Driver(Thrustmaster) Source
USBWHEEL.COM USB Wheel Driver (Thrustmaster)
USBTEST.COM USB Human Interface Devices (HID) Test Program
USBJOYPD.SRC USB digital Joypad Driver Source
USBJOYPD.COM USB digital Joypad Driver
USBJOYST.SRC USB analog Joystick Driver Source
USBJOYST.COM USB analog Joystick Driver
BOULDER.COM Boulder Dash 1 for USB digital Joypad
```

All driver will simulate a normal Atari Joystick on Port 1 and will also
give access to the USB HID Registers for that device.

We will publish a Users Manual and a Developers Manual for each driver
shortly.

The USBTEST.COM HID Test Program will detect an Human Interface Devices
attached the USB Cart. It will poll the USB Device and will print out the
8 bytes in the HID Packets when the device sends data. Any Atari Key will
stop the polling. Type USB[RETURN] to start polling again, hit return to
attach a new USB device. Type MON to go to DOS.

If your device is not working with the available drivers, test this device
with the USBTEST.COM Program. If you see values, we can write drivers for
this. If not, then the device is using a non-HID Protocol or is attached
to an internal USB HUB and will not work today.

If you have problems, send us your problem reports ONLY via the
Sourceforge Bugtracking System (not E-Mail or in any forum)

The Bugtracking System is at
https://sourceforge.net/tracker/?group_id=111428&atid=659189

Please list:
* Type of device
* Device Name
* Vendor
* Drivers tested
* Output of USBTEST.COM (sorry, you have to type it from the screen for now)

Best regards

Carsten Strotmann

4052. Atari USB Project - Call for collaboration

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-05 19:22:42 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2004.12.05.19.22.42.14932@strotmann.de>
Source record: 13811

Atari USB Project - Call for collaboration

The Atari USB Project (aka MicroUSB) has hit its first milestone with the delivery of the first USB Cartridges last week. But the project is not finished, indeed we are just starting. There is a lot in USB that we will discover and a lot of work is ahead of us.

The MicroUSB Project is an OpenSource, volunteer driven Project. All Software and all Documentation is free and will be free available in the future.

One of the most frequent request is if it would be possible to attach USB Memory Sticks or other USB Storage Devices to the Cartridge. The answer is most probably yes, but this will be a lot of work. We are already working on this in the last four month, but we have to split our time also for creating other drivers and documentation.

Here is where we need your help. If you are interested in supporting this project, please consider joining the team and giving us your help. You must not be a top class developer to be part of the team, as there are a lot of non-programming tasks to do. Here is a list of tasks that needs to be done in the next weeks:

* Documentation
* writing End-User Documentation for the Hardware and the existing Driver Software
* writing Developer Documentation for the existing USB Driver
* how to use USB Driver in Basic/Turbo Basic * how to use USB Driver in Assembler
* how to use USB Driver in ACTION!, Quick or any other Language
* Development
* improving the existing HID Driver (Keyboard, Joystick, Wheel)
* make them RESET resistent
* chain them in existing VBI driver
* optimize for size (resistent part)
* adapt existing driver for more HID Devices (other Wheels, Force-Feedback etc.)
* Test
* Test Hardware
* test different kind of USB Hardware with drivers and send us feedback
* Misc
* take care of our Website http://www.microusb.org
* take care of spreding news into the ATARI newsgroups and forum-websites
* write articles for Magazines (MyAtari, ABBUC Magazin etc.)

* translate Documentation
* ...

Before starting to work on any task related to Atari USB please contact us. We will coordinate all work and will make sure that no work is done twice.

Your help can make a difference. Help us to speed up USB development. Become part of the team.

Carsten Strotmann

We're not last, but we're still shooting for that title. :)

From space.atari.org (where these are hyperlinks):

Active Atari computer user groups with which SPACE exchanges newsletters:

* Indiana-Michigan Atari Group Exchange (IMAGE) (South Bend, IN)

* Suburban Chicago ATarians (SCAT) (Chicago, IL)

More active North American Atari computer user groups:

* Atari Bay Area Computer User Society (ABACUS) (San Francisco, CA)

* Atari Computer Enthusiasts of Columbus (ACEC) (Columbus, OH)

* Garden City Atari Computer Enthusiasts (GCACE) (Victoria, BC)

* Houston Atari Computer Enthusiasts (HACE) (Houston, TX)

* Miami International Atari Users Group (MIAUG) (Miami, FL)

* San Leandro Computer Club (SLCC) (near Oakland, CA)

Corrections to the above list appreciated!

SPACE continues on with a small, core group. We still publish a monthly
newsletter, and still produce a DOM each month. We have the SPACE BBS too.
Details at http://space.atari.org .

Anyone can join SPACE. Call Lance at 651-462-2500 if you'd like to join SPACE
from "long distance."

Thanks.

-Michael

SpartaDos X was written by Mike Gustafson, an ICD employee. He wrote all of the SpartaDos versions, and most of the software ICD had. There were a couple of other guys, like Howard Peters who did some of the utilities, but Mike did most of it. He's a pretty sharp coder.

4062. Question regarding SWP ATR-8000 and floppy drives.

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-06 21:41:41 UTC
From: stephensheppard@hotmail.com
Message-ID: <1102369301.046421.284340@z14g2000cwz.googlegroups.com>
Source record: 13819

I'll give the short question first and then the background.

Did/do floppy drives of the ATR-8000 era require some sort of
termination?

The problem I am having is I can not connect two identical drives to
the ATR-8000 at the same time. The drives are Teac model 2136, single
sided, double density. Each drive works individually but not together.
I've tried manual drive select (straight thru cable), setting DS0 for
drive 1 and DS1 for drive 2. I've also tried cable select using a cable
with the "flip" in it and setting both drives to DS1. No matter how I
configure I get boot errors if two drives a connected to the floppy
cable, even if I uplug the power from drive 2.

I've tried "tricking" the drives. I booted to DOS (MyDOS 3.19) with
one drive connected. I then shutdown the drive subsystem, reconfigured
for 2 drives, then powered the drives and the ATR-8000. When I try to
access the drives I get read errors. I also get a strange result. If I
try to read disk 1 or disk 2 (D1: or D2:) then the drive light comes on
for disk 1. OK I figured that since I booted with just the one drive
then perhaps MyDOS only recognizes the one drive. However, on a wim I
tried to read from D3. This activated physical disk 2 and I still get
only read errors.

This seems like a termination problem except I don't recall ever having
a termination block on these drives.

There is an empty 16-pin DIP socket on each of the drives but the
socket is unmarked. I'm hesitant to put a terminator block in the
socket (plus I don't have one at this time anyway). [By the way, does
anyone have the pinout for a 16-pin DIP terminator?]

These drives were working together 15+ years ago, with the ATR-8000, I
just can't recall how I did it.

Every couple of years or so I turn on the Atari 800 and fool around
with it but I never needed the second drive so I never discovered the
problem.

Now the reason why I am trying to do this...

Recently I discovered an Atari 800 Emulator. I think it's called
Atari800win. I also found a couple utilities, Atario and Dskutil, that
will allow me to copy Atari files onto my PC. The problem is the
utilities can't read single density diskettes so I need to move my
files from the SD orginals to DD copies (and I need to do it soon
because the originals are deteriorating, slowly but surely, mostly from

neglect). There's nothing important, just personal nostalgia, but I would like to preserve what I can. Copying files with a single drive on the Atari 800 is intolerable and unreliable. There are too may disk swaps required and MyDOS frequently corrupts the disk copy increasing the frustration. This is why I want to get the second drive working. I don't have any other Atari compatible drives.
Thanks in advance.

I can't tell you about your ATR-8000 and its' drives, configuration.
Your goal, however can be attained using an APE/SIO2PC cable and your PC. I believe unregistered APE allows Atari to PC copies, just not PC to Atari copies, if I remember. With the APE interface, you can copy your sngl density floppies to a single density .ATR image, assuming these are not copy protected. If you have copy protected disks, one of Steve Tucker's APE+PRO cables will even allow making PRO images.
You can make an APE interface with a SIO cable, a PC serial cable and just a few dollars in parts, 1489 chip, maybe a couple resistors and a cap.
MyUtil and Atario were used before the APE/SIO2PC advent, and weren't reliable in my experience. And, a lot of people don't have a 5.25" drive on their PC, and when they do it is a HD drive, which won't work with MyUtil/Atario.

Thanks for the SIO2PC suggestion but I only have one SIO cable and I can't spare it. Foolishly I threw away my 410 tape player not too long ago. (I don't know why, after having saved it for 23 years). Unfortunate, because I could have salvaged the SIO connector.

I was just hoping for a quick fix. Atario works fine for my double density disks. DskUtil worked even better (accepts wild cards). I was able to transfer about 8 disks worth of files to my PC. 3 disks were originally double density. The other 5 disks I compiled from files copied one by one from the single density originals to the new double density scratch disk. During the copy process I managed to get disk corruption 3 or 4 times forcing me to start each compilation from scratch. Prior to that, I had the frustration of trying to find a DD diskette that would even format reliably. I only found 2 reliable diskettes out of about 1.5 dozen. (I think I'm paying the price for buying cheap diskettes and generic diskettes two decades ago. LOL!)

This whole process has taken hours so far and I've only completed about 20% of my task.

By the way, I used a 1.2 MB (HD) 5.25" drive to import the files to my PC. That wasn't a problem at all.

I do have a major problem though. I can't copy files the other way, from the PC to the Atari.

Formatting from the PC is no good because DskUtil formats both sides while my ATR-8000 drives are single sided. Disks formatted with the Atari almost work. I can use DskUtil to write to the disk from the PC, I can verify those file onh the PC, and I can see the directory on the Atari but I can't read or copy the files on the Atari. I get error 144. Very frustrating to get that close.

I guess it's not that major after all. I don't really enjoy using the real Atari anyway. The keyboard has become very quirky over the years. Touch typing is impossible.

I have an Atari 800, by the way. I'm the original owner from 1979 or 1980 (can't remember exactly).

I probably will keep plodding along with these tedious SD to DD copies until I have everything I want, export the files to my PC, archive them to CD, and be done with this. I only have to do it the one time.

Thanks again for your help Russ. Maybe my enthusiasm will return and I'll build one of the SIO2PC interfaces.

Stephen,

Yes, drive connected at the far end of the cable should be terminated.
That also means that single drives should be terminated. If your
cable length is short termination is less important, but should be done.
I don't know of a Teac model 2136. My preference was for Teac
drives, but the model I used most was the FD55B, which was DS/DD.
The SS/DD equivalent was the FD55A. The FD55x series of that
era used a resistor network. Off the top of my head I cannot remember
the value. I have the service manual for this series, but I will have to find it
in the attic. Once I can get the info, the part should be relatively easy/cheap
to get. Jameco Electronics has 16-pin resistor networks for about 50 cents.

Does anyone remember the name of this Atari 8-bit game?

You were on (I think) a spaceship. You're job was to escape with as
much equipment as you could before some kind of alge or fungus took
over the ship. It was a top-down view and you could shoot doors to
seal them shut from the fungus, giving you more time beofre the fungus
broke through. I seem to recall that you lost energy if you bumped
into walls. The fungus would grow as time went on.

Anyone want to give this one a shot?

E-mail with response if you can. lighthope@onepost.net

4069. ANNC: Joystick adapter (fwd)

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-07 08:18:11 UTC
From: Robert Bernardo <rbernardo@iglou.com>
Message-ID: <Pine.GSO.4.61.0412070317360.8978@shell1>
Source record: 13826

---------- Forwarded message ----------
Date: Tue, 07 Dec 2004 06:44:11 GMT
From: Jim Brain <brain@jbrain.com>
Subject: ANNC: Joystick adapter

For years, gamers have contented themselves with the venerable Atari-style joystick as a gaming input device. The joystick is simplistic, yet adequate for many games.

However, as the games become more complex, a simple joystick is no longer ideal. In the arcade arena, coin operated machines sprouted new buttons for special functions and extra control of the player. However, on the home front, computing platforms like the C64 and Atari have dealt with the inadequacy of the joystick by using the keyboard as an additional input device. However, the effect is sometimes distracting, taking one's eyes off the screen to fumble for the correct key to press for certain actions.

Thus, I present my latest project, which was announced and demonstrated at the recent TPUG World of Commodore EXPO:

The PSXJoy adapter

This adapter interfaces a standard PS1 or PS2 controller to machines using the industry-standard 9 pin Atari joystick/paddle connector.

Features include:

o The unit emulates the Atari joystick up, left, right, and fire buttons
o User can configure which set of PSX buttons or which joystick maps to the joystick inputs
o User can configure which fire button emulates the joystick fire button
o Paddles are emulated on certain platforms
o Requires no additional power source
o Option to support additional fire buttons on Atari 7800 joysticks
o Configuration can be set using the controller buttons
o Works with many PSX style controllers, including wireless units

While the above features allow one to use the PSX controller to provide existing joystick functionality, they do not unlock the full potential of the newer PSX controllers. Thus, the unit operates in two modes. One is called compatibility mode, and provides the above features. The second mode is called expanded mode.

In expanded mode, the unit can be instructed to send the entire controller data packet to the host computer using just the 5 lines of the joystick port. By redefining the FIRE pin as a host generated CLOCK signal and transferring data via nybbles, the raw PSX controller information can be retrieved from the

interface. In expanded mode, all PSX controller buttons and analog information is available for game use. Of course, games require modification to utilize this new mode.

Data can be retrieved from the unit at 60us/byte, making it short enough to be used in a single scanline routine. As well, additional safeguards were added to allow operation on platforms that use the joystick data lines for other purposes (Commodore C64, for example). The unit requires a 4-step key be sent to the unit to switch into expanded mode. The unit can also be placed into into a fast "passive state" to allow systems like the C64 to scan the keyboard while the unit is sending raw data. Data can be sent from the host system to the PSX controller, enabling use of newer controller feedback modes, like the "rumble" function on PS2 controllers.

Pictures of the unit and a small time sequenced picture series are available at http://www.jbrain.com/vicug/gallery/psxjoy

Technical details:

The unit is powered by an Atmel AVR MEGA8 controller, using a minumum of additional components. The entire interface requires just the AVR IC, 4 resistors, the DE-9 jostick and PSX connectors, and a nominal amount of wiring. There are plans to commercialize the unit for sale.

All major development is completed on the unit, but I am interested in soliciting feedback on various options, including:

What configurations should the unit provide?
What additional commands should the unit's expanded mode support?
Any issues in the code that need addressing?
Testing on various platforms for compatibility.

I'm also interested in hardware capable folks who want to build a unit or two and help me test.

The plans, source code, and schematic are already or will be released under the GNU Public License (GPL).

The interface hardware can be also used to support other types of controllers or alternative input devices.

Jim

Several months ago, we had a short thread about the German Enigma machines, and of course, Alan Turing. I recently watched a History Channel program "Codes" on the "Modern Marvels" series. But I think that I recall an earlier program that largely dealt with Alan Turing and his code-breaking "bombs". Does anyone remember this episode? I want to record it next time it's on. Maybe on "Dead Men's Secrets"? I looked at the available History Channel products for sale, but didn't see anything other than "codes".
Thanks,
Larry

Hi Stephen-

> Recently I discovered an Atari 800 Emulator. (...) I also found a couple utilities, Atario and Dskutil, that will allow me to copy Atari files onto my PC... <

Of course, if you really want to use disks to move your software to ATR images, then dual drives (with termination) is the only way to go.

So you would 1) copy files from SD to DD. Then 2) copy from Atari DD to a DD ATR image. Why not get an SIO2PC or APE cable? Use the APE software or "Atari810".

It is much faster and more reliable. If you are inclined, the cable is fairly easy to make. If not, they are not expensive. In the long-run, you'll wonder how you tried it any other way. An added advantage -- you can copy disk to disk which is much faster than file copying to change density.

Since I had never used APE with my ATR8000, I set it up this morning to test it with my older Pentium III laptop. Worked beautifully. Links are easy to find (or ask) if you decide to do this.

This is not true if you include all the AppleII models, because the AppleIIGS beats them all, but the AppleIIGS is a 16 bit machine with the unique feature of being backwards compatible with it's 8 bit predecessors. No other 16 bit machine from the other brand manufacturers at that time had this unique feature (except the 286, but the 8086/8088 was advertised as 16 bit architecture). E.g. see - the SinclairQL - incompabtible with the Sinclair ZX, AtariST - incompatible with 8 Bits Ataris, Amiga - incompatible with C64/128 *.

*You can run 8bit software on these machines only through software emulation - much slower.

Sounds like that old chestnut "SS Achilles", by Beyond Software. My
buddy and I played this back in the day and were amused at how it starts
out deceptively easy, but can get pretty hectic before you realize it.

Check it out at a website like www.atarimania.com and tell us if that is
what you were thinking of. BTW, I THINK I saw this same game under
another name somewhere, but am not sure.

>from the PC to the Atari.

Disks written with an HD drive (or more precisely, with an 80 tracks one)
can't normally be read with a DD drive. Yes, the other way around is
possible.

The only way to do that is to use virgin unformatted disks, and formatting
them as 40 tracks in the HD drive.

This is completely unrelated to the Atari/PC issue or to the number
of sides or even density mismatch. You had exactly the same problem when
trying to read with an old PC XT , disks written with a PC AT.

I found my service manual. I was wrong. On the FD55x drives it is a 14-pin
resistor array/network. I found two references indicating that it is 330 ohm and
one place in a parts list with a value of 1K ohm (This might be an optional value.).
The resistors are connected straight across the pack (pin 1 to 14, 2 to 13, ..., 7 to 8).
As I said Jameco Electronics (www.jameco.com) has a 16-pin version (Jameco
part number 108572). You could just cut off two pins at either end.

Hopefully this link won't get truncated.
http://www.jameco.com/webapp/wcs/stores/servlet/ProductDisplay?langId=-1&storeId=10001&cat
alogId=10001&productId=120097

You should also be able to find one at a good electronics parts house.

Good Luck,
Richard

(We're talking about getting Atari files to a PC. SWP ATR-8000.)
One more thing, it would be very advisable to use CRC checking to be sure your file transfers are correct. You would do a CRC on the Atari and then use a CRC checker on the PC. You might be surprised how often your 'successful' file transfers are corrupted. I can e-mail you my CRC checking programs, one for Atari, two for PC. It is good practice and could save you some headaches. Remove MUNGE to send me e-mail.

Thanks all, Russ, Larry, Jorge, and Richard, and anyone else to follow.

Kudos for all the tips.

I need to pay more attention. The socket for the resistor pack is
14-pin, not 16-pin. The drive model is Teac FD-50A not 2136 which
turned out to be one of the drive motors.

Assuming I get dual disk operational. How do I create an ATR file with
the Atari? Is that just a MyDOS subdirectory? Can I make ATR files with
the collection of binaries that I have already ported to the PC? How?

I wasn't planning to build an APE interface because the 800 is dying.
I just now have glitchy video, the keyboard is already troublesome, and
some time ago the power adapter blew an internal fuse, (weird little
3/8" piece of PCB with just a wire strand).

Regarding formatting floppies, since virgin DD floppies are so hard to
find has anyone one tried a bulk tape eraser on used floppies? Would
that completely wipe a floppy?

Stephen Sheppard

Thanks for the offer Russ but at present I have no way to get programs from email to the Atari.

Now that you have mentioned it, I seem recall having such programs at one time. Doubt I can find them.

I like your idea, though. I'm not sure I can write a CRC checker but I can easily write a crude checksum. Two byte precision ought to be enough. That would show 65535:1 likelyhood that the transfer is correct.

> Stephen Sheppard
You might be able to completely erase a floppy with a tape eraser. I used
to use a pair of electro-magnets mounted on two boards. You are correct
that any DD disk that has been formated before can't reliably be used with
MyUtil or Atario. It is best to format a clean DD disk on the PC for use
with MyUtil. I wan't happy with MyUtil, so I wrote my own Atari<>PC
transfer program. It was fairly reliable. You would write a file to
sectors, not to a DOS file, then read the file off the sectors at the other
end, whichever direction you were going. Since you're playing with DD
transfers, you might want to see my programs, one for the Atari, one for the
PC. My PC program will write MyDOS and the Atari sector reading/writing
program to a DD disk. If it worked you'd then be able to use my programs on
the Atari and PC.
... An ATR is a disk image with a 16 byte header. I'm not sure why you
want to write ATRs using the Atari. Disk image writing for the Atari is
usually done with Bob Puff's Disk Communicator 3.2, making DCM files.
You might want to take one of your Atari disks, then use Bob Puff's Super
ARC program to make an .ARC file of all the files on the disk. Then use
either my programs, or MyUtil and read the ARC file from the Atari disk to
your PC. I think modern day archiver programs for the PC still support the
ARC format, power archiver is one for the PC.
Once you have your files on the PC, there is a PC program to add files to
ATR image that you can then use with Atari800win or other emulator (XLIT).
The PC program for doing this, will work with DOS 2/2.5 sngle dens. image,
is called IMAGEMAN. There may be others.

I'm giving up business until end of 2004 and still have large qts. of hardware and games.

Shipping :

up to 15 games : $14
up to 40 games : $35

Payment is possible with paypal.

ATARI XL/XE games are NTSC.ATARI 2600 games mostly PAL when NTSC isn't mentioned.

Contact : webmaster@klassische-videospiele.de
or lord-chaos@t-online.de

All games new & boxed.

Thimo

Hardware :

CX-30 Paddles , ATARI, new and boxed , $8 , ca. 20-30 available
CX-50 Keyboard Controllers, new and boxed, $6 , ca. 100 available
Telegames Joysticks , new and boxed, $5, ca. 100 available

Footpedals, ca. 800 available, $1 each (heavy), $0.50 if you take them all.
(They take a lot of space and I have to throw them away if nobody buys them).

Sears Paddle/Joystick Controller, $3, ca. 100 available

GAMES :

(*) means 20+ copies available

ATARI 2600 :

5.00 Acid Drop (Salu)
5.00 Adventure on GX-12 (Telegames)
5.00 Alpha Beam with Ernie (ATARI) Kids Controller req.
4.00 Armour Ambush (Telegames)
2.00 * Astro Blast (Telegames)

Depending on the eraser it probably will. BUT it will not restore the disk to the virgin state. You need a "degausser", usually a very expensive equipment, to do that. They perform different types of erasing. I'm not sure which results you will get with a bulk eraser.

Brand new DD unformatted floppies aren't really too hard to get. But note that this is required only for transferring from a HD drive to a DD one. Not for the other way around.

yeah?

Anyone that sends me an email can have a copy of Holme's 8-bit CDs that he gave to me in a contest, with all those nice 8-bit games that he had on his website, all for the low low price of shipping, handling, and creation of the CDs.

In most parts of the U.S. and even in many countries, I found that $9.99 covers all the costs of doing this. There are 3 CDs total.

Also note, that the CD-Writer that I use is a new one that utilizes the 700MB CDs. In some circumstances, I have found that the CDs do not work in very old CD players.

> Assuming I get dual disk operational. How do I create an ATR file with
the Atari? Is that just a MyDOS subdirectory? Can I make ATR files with
the collection of binaries that I have already ported to the PC? How? <

I believe there is a list of software available in the csa8 FAQ's for floppy to
floppy Atari to PC interchanges. At any rate, an ATR image is just a file with
a 16 byte header that gives info about the disk, followed by a complete image
of the source disk (sector by sector). Nick Kennedy's SIO2PC site has docs
that explain the header. Since you are going from SD to DD, it should be
feasible with floppies.

You can also make DCM images using Disk Communicator 3 (DISKCOMM). Then
convert them on the PC to ATR's using Imagic (from the author of APE). DCM's
have the advantage of compression, although there are also some compressed
ATR's. Sounds like extra steps, but it is sooo fast on a PC, they can be
converted as a batch essentially in a couple of seconds. More than one way...

> Regarding formatting floppies, since virgin DD floppies are so hard to find
has anyone one tried a bulk tape eraser on used floppies? Would that
completely wipe a floppy? <

I have had very good success using a bulk eraser on floppies. I have an older
Radio Shack model for DD disks and a more powerful one for newer chromium
tapes, HD disks, etc. Follow the instructions and I'm sure you will get good
results. Remember to pull the eraser several feet before you release its
switch. There are also "bulk erasing" disk utilities for the PC. They randomly
flip the bits so fast, they are essentially "erased".

Good luck,
Larry

Very accurate (though there is always room for improvement).

> I heard that they left open the ability to solder in
> a keyboard connector or a drive connector

Yes, you can attach a PC keyboard (if you don't care to use the
on-screen virtual keyboard), and you can attach a serial port connector
in order to use a disk drive (or even hard drive).

Hello,

I am playing Omnitrend's Universe 1 with an Atari800WIN Plus Emulator.
I am playing with 100% speed and without the SIO-Patch.
If i come to the Drydock Menu and will go in the Parts Removal Section then
start a disk access from the Flight2-Disk, which is currently inside, from
sector 697 to sector 715 which will always loop.
Can anybody help me, maybe if i will send further information?
I tested already 2 versions of the atr-files with OS-A, OS-B and XL and made
also various new player-disks but always come into this loop.

BTW. the monitor of this emulator is nice, but i am not able to use it much
because of lucking knowlege regarding to machine-language.

Kind regards

Spezi

It seems pretty spot-on to me, but then, I'm not a C=64 guy either,
and hadn't played most of the games that are on it. Those I did seemed
perfect, but... haven't played THEM in years. :^)

I know one thing, though... when I played "Adventure" on the Atari 10-in-1
joysticks, I could tell immediately that it wasn't even emulation. :^P

I bought two C=64 DTVs from QVC. One for my brother (C=64 guy in the
family), and one for my boss (who's not a 'gamer' like I am, but was
also a C=64 guy back in the day). I think they'll both appreciate the
nostalgia, as well as the convenience.

I doubt either will ever even consider 'hacking' theirs to do the
keyboard add-on or anything, though.

>> We need that for Atari XLs! :^)
>
> That would be so sweet!

Yeah. We need the good games, though! That can be very tough. :^/
Fortunately, Atari had a number of great games back in the day, so it
should be trivial for /them/ to include good games on such a device.

On-screen keyboard? How do you get to that? One thing I found VERY lacking in the DTV was instructions. Admittedly, I only glanced over them, but when I got to points in games where I had NO idea what I'm doing (like, how to bobsled for more than 2 feet in Winter Games), I was left high and dry.

Is there a good DTV website? (either official, or community-driven?)

(Uh oh! Getting off-topic!)

4100. PRO image to real FLOPPY?

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-08 20:39:23 UTC
From: Gork <nokraygienspam@hotmail.com>
Message-ID: <10repkab50q1e0@corp.supernews.com>
Source record: 13657

I just recently purchased a HAPPY enhanced 1050 drive. In learning how to use it I accidentally erased an irreplaceable floppy which has bad sectors on it. I have a copy of the floppy in a PRO image on my PC.

Does anyone know of a way to copy the PRO image to an actual floppy? The two bad sectors are at 367 & 368 (16F & 170), and I tried using the HAPPY software to copy just those two sectors from another disk with bad sectors in the same spot. Sadly, apparently, the HAPPY software doesn't copy bad sectors with its "sector copy" option, only its disk copy option.

I can't think of another solution. Naturally, I'm not anywhere near being able to remove copy protection from software...

Sean

In first place make a backup of the disk.

Use the Backuper (Disk copy option) to copy the specific track with
the bad sectors. Using the special recovery menu you can choose which
tracks to copy. Those sectors are located in track 20 (I assume the
disk is single density.

Alternatively, you can use the Happy 1050 Archiver software (scan-it)
to manually create the bad sectors. This will erase and reformat the
track. This software is more flexible, but it probably requires more
technical knowledge.

Then copy the good sectors over this track 20 (all sectors except the bad
ones).

Note, this will work as long the bad sectors doesn't have any data.
If they are of the more advanced protection type, then the procedure
is a little more complicated.

Now that makes the product a lot more interesting than running six
games or whatever!

I picked up the Intellivision variety of these gadgets but didn't care
for it too much. There was novelty but the games weren't much fun. I
don't think they were faithful versions of the originals. I think they
were watered down, hacked up versions modified to get a minimal level
of functionality on the gadget.

But if you can add a keyboard and a diskdrive and maybe have some
network feature, that opens up a lot of neat possibilities!

Thanks for the help! And, please forgive my ignorance as you read...

> In first place make a backup of the disk.
Yeah, hindsight... Actually, it was a really stupid mistake... I was using APE with the same drive letter as the HAPPY 1050 and forgot to turn the 1050 off. Luck of the draw - when I tried to format the APE drive the HAPPY is the one which received the command. Argh... Kind of dumb, I know...

> Use the Backuper (Disk copy option) to copy the specific track
The Backuper? If you're talking about the disk duplication program that comes with the HAPPY hardware ("HAPPY BACKUP"), I don't think it will work. It won't read from APE, which I need to access the PRO image - it will only read from actual HAPPY enhanced hardware. If you're talking about something else, please advise.

Additionally, the only option I can see in the SPECIAL RECOVERY MENU regarding tracks is "Select TRACER tracks." I don't think this option would work to copy the bad sectors from different disk with errors on it because the "substitue" I'm using doesn't access those bad sectors during load. I'm very new at this though, and am probably misunderstanding something. (Oh, and yes, the disk is single density.)

You must feel like you're talking to a dummy here.. I don't have any Archiver software on my HAPPY floppies, and nothing called "scan-it." I did try loading the Happy to Archiver conversion tool and running "The Archiver," though. From there I copied the entire track of bad sectors from the disk using the editor. The problem with this? Normal software wouldn't copy the good sectors back over the bad written with The Archiver. I tried both the sector copy program which comes with HAPPY, a BASIC program called Diskey and SmartDOS.

I'm not sure if the bad sectors have data, but it actually appears that they might. I'm not sure if scanning specific sectors of a copy-protected PRO image renders the same results as it would with a physcial disk.

I've tried everything I've mentioned above - I've been up all day long working on this. (I'm a day sleeper.) It's been driving me crazy! I almost gave up at one point to get some sleep, but at the last second another idea hit me. My how the last 4 hours have flown by. hehe

Hard to fit the instructions of 30 games into a little package.

> Is there a good DTV website? (either official, or community-driven?)

Enterprising people have already started to hack the internals to
the C64 DTV 30-games-in-one joystick. To read and see how they did it, go
to the following sites:

http://www.orrville.net/dtvhacking (same as http://dtvhacking.info)

Of course it won't. If I understood you correctly, you have another physical disk with the same protection. So you can copy from this disk, not from the PRO image.

> Additionally, the only option I can see in the SPECIAL RECOVERY
> MENU regarding tracks is "Select TRACER tracks." I don't think
> this option would work to copy the bad sectors from different disk
> with errors on it because the "substitue" I'm using doesn't access

That option is precisely for *manually* selecting tracks. The tracks don't need to be accessed at all. You only need that if you want the happy to *automatically* determine which tracks to copy.

> I don't have any Archiver software on my HAPPY floppies, and
> nothing called "scan-it." I did try loading the Happy to Archiver
> conversion tool and running "The Archiver,"

It looks like you already have "Scan-it", or some other tool with similar functionality. It doesn't come with the Happy.

> From there I copied the entire track of bad sectors from
> the disk using the editor. The problem with this? Normal software
> wouldn't copy the good sectors back over the bad written with
> The Archiver. I tried both the sector copy program which comes
> with HAPPY ...

The track you copy (or create with the Archiver editor) must have the same bad sectors as your original one. The rest of the sectors of the track must be good. You can't write over bad sectors (not if they are really bad sectors).

So you must have another disk with exactly the same protection in the same track for using the Happy backuper. With the Archiver you don't need that, you can modify and "invent" the protection in the track.

> I'm not sure if the bad sectors have data, but it actually
> appears that they might. I'm not sure if scanning specific
> sectors of a copy-protected PRO image renders the same results
> as it would with a physcial disk.

They should or lot of protections will break. Use Scanalyzer or some other similar tool and see exactly which protection is in that track.

> physical disk with the same protection. So you can copy from this

I'm sorry, I haven't been clear enough - I'm very new at this sort of a thing. I was using a completely different disk (The Archiver disk, actually) and pulling off bad sectors at the same location on that disk whch match the bad sectors on my "lost disk." I am learning as I go along and understand the error of my ways.

> That option is precisely for *manually* selecting tracks. The tracks

Indeed it is. Thanks for screwing my head on a little more tightly regarding that matter! I misunderstood how it works. I'm not doing TOO bad for having this drive with the software for less than 24 hours, though. :) I tried to use the Tracer option, but I was going through and performing the trace and couldn't get it to read track 20... I just didn't understand.

> It looks like you already have "Scan-it", or some other tool
> with similar functionality. It doesn't come with the Happy.

Are you referring to a specific piece of software called "Scan-it?" Anyway, I do have the HAPPY Archiver software. We used Archiver way back when, and I don't remember any of the commands. (Not that I was ever that proficient at it anyway.) I've been trying to figure out the Format portion of the program, and I'm afraid I'm lacking in expertise. I'm plucking away at keys and writing down notes, but the hard part is going to figure out what the numbers in the Formatter mean and the commands in the Dissasmbled sectors. I'm sure my father wouldn't be able to find the manual after all these years... I vaguely remember being able to create bad sectors on the fly, but I can't figure out how to do it anymore. But, that's not an issue anymore, I don't believe, with my current problem. I'll get into that in a sec. (And I WILL keep trying to learn more about Archiver and creating bad sectors etc.) I didn't remember ANY of this until you started saying something. Funny how memories work... Anyway, everything you said is now making more sense to me. Funny what sitting in front of the computer trying to figure things out for hours on end will do, huh?

I located Scanalyzer - thanks for the refererral. It verified that sectors 367 & 386 are the culprits. 367 "has bad data marks (data-mark-1) - error=144, status=223." 368 "has CRC error - error=144, status=247." There is other data in both these tracks. And since I had only formatted my original floppy I scanned the same sectors off it with Scanalyzer. Both sectors had the same information as in the PRO image, but neither showed as bad. (I assume that's because of the format process.)

I have created a floppy with all the information on it from the original floppy, including the data in those two sectors. Naturally, the two sectors do not show as bad and the program on the floppy won't boot. Am I going about this in the correct manner now? If so, I assume I just have to figure out how to create "bad data marks" and a "CRC error" in these two sectors. I'm not sure where to begin on this leg of the journey, but I'm certainly not ready to give up yet.

Sean

>
> Are you referring to a specific piece of software called "Scan-it?"

What you have is probably "Scan-it". I think it's the only CHIP
(Archiver) emulator for the Happy 1050. But doesn't matter as
long as you can run the Archiver software, then it's ok.

> but the hard part is going to figure out what the
> numbers in the Formatter mean
...
> It verified that sectors 367 & 386 are the culprits. 367 "has
> bad data marks (data-mark-1) - error=144, status=223." 368 "has

The numbers you need on the formatter are precisely the status
shown by Scanalizer.

> If so, I assume I just have to figure out how to create "bad
> data marks" and a "CRC error" in these two sectors.

Yes.

The Archiver manual is somewhere on the net. Make a search and
you will find it (sorry, don't have an URL).
```

4112. 1010 Tape Drive / 1025 Printer looking for home

These are free (of course, you pay for shipping) if anyone wants them.
Also a couple of tapes.

The belts need to be replaced in the 1010.

I think the printer works but I never tested it, it also weighs a ton
and would be very expensive to ship so I'd prefer pick up (Montreal,
Quebec. But if you want to foot the bill, be my guest).
I'm in Montreal, Quebec.

Thanks for everything - you've led me down a learning path that I've really enjoyed. I'm actually thinking of purchasing a super archiver chip for my other 1050 now. I doubt I'll need it very often, but it'd sure be nice to have it for those advanced tools.

If anyone has anything further to add as far as using HAPPY or the CHIP to create these bad sectors I'm all ears. Additionally, if anyone runs across the Archiver manual on the Net I'd appreciate hearing from you as well. I spent a couple of hours trying to come up with it and am so far empty handed. I'd love to hear from anyone with further information or questions.

And again, Jorge, thank you so much for your time.

4114. Copy protected disk project, seeking beta testers

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-09 19:02:18 UTC
From: Jorge <user@nospam.com>
Message-ID: <cpa7fqdaf1@blue.rahul.net>
Source record: 13671

Project for handling ATARI copy protected disk.

The project is a package of tools for:

- Imaging copy protected disks.
- Writing back the images to a physical disk
- Using the images with a real computer with a SIO2PC cable.
- Using the images under emulators.
- Public preservation tools.

I m seeking beta testers with the following requirements:

- A fair number of *original* copy protected disks.
- A minimal technical knowledge. You don t have to be an expert,
but you can t be a beginner.
- A PC running Windows
- Recommended a SIO2PC cable connecting the PC to a real Atari.
This is not mandatory, but highly recommended.
- Plus anyone of the following hardware:

- A Happy 1050 drive connected to the PC with a 1050-2PC or Prosystem
cable.
- A PC with a Catweasel card and a 5.25 drive.
- An Atari ST with the Discovery Cartridge and a 5.25 drive.
- A parallel port Disk2Fdi cable with the registered version of
DISK2FDI software, plus a 5.25 drive

The above hardware is not a requirement for using the software. But it
is for participating in the beta. Only one of the above is needed. The
capabilities of the imaging tools vary depending on the hardware.

Those active in the ST scene might have seen I recently partially released
Pasti. This project is similar in functionality to Pasti, but of course it
is
for the Atari 8-bit.

Those interested and meeting the requirements please contact me by email
at the domain "fxatari.com" user "atari" (described like this for obvious
reasons).

Jorge

I just wanted to drop a quick line to let those who read the thread know that I was able to accomplish this task, thanks to help from both Frombrhs1962 (offline) and Jorge, as well as a couple of others. Thank you both IMMENSELY!

I basically just followed Jorge's instructions in this thread, but FINALLY came upon some partial Archiver documentation. This documentation reminded me of the B command on sectors in Archiver Editor. B toggles between seven different kinds of bad sectors the program allows you to write.

After learning from my mentors, and after being turned on to Scanalyzer, I was able to discover what sectors on the PRO image were marked as "bad," and what kind of "bad sectoring" was used. I then set Archiver to write a "deleted data mark sector" to sector 367 and a "deleted data mark sector + CRC error sector" to sector 368. That did it!

One odd thing, though. Archiver won't copy the disk now... <scratches head> It USED TO!

I've been hooking up some of my older hardware, and today it was the MIO's turn. Attached the MIO and an ST-251 + Adaptec bridge controller, and it took right off -- right where I left it about 10 years ago. I still prefer my Black Box, but I do miss the MIO Ramdisk(s). Is anyone else still using an MIO? Pretty cool stuff.

I just found my old Action! cartridge but I don't remember much about
it. I do remember getting one upgrade replacement cartridge from OSS
at some time. I wrote a note in the manual indicating that the last
version I received was 3.6.
How do I check the version number to confirm this?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hello Doc,

I have the MYide cart also. Have not used it yet. What IDE drive are you using with it? I also have the USB cart. I have not downloaded any drivers but I have heard there are some for various mouses. Do you know of any others out there? This is all great for the 8-bit, what next? Maybe an Ethernet cart of some kind would be fine. I heard this is coming.

4125. Extend Basic 1.0 - information wanted

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-11 01:13:01 UTC
From: stephensheppard@hotmail.com
Message-ID: <1102727581.961797.76310@c13g2000cwb.googlegroups.com>
Source record: 13682

I have this disk. When I boot it with an Atari Basic cartridge
installed in my 800 it displays the message "Extend Basic 1.0" then
"Ready". I know that it is some kind of enhancement to the Basic
editor environment. The only command that I can remember is "dir.",
which displays the directory of the disk. The DOS command has been
surpressed. I vaguely remember that with this utility most of the DOS
functionality is available from the Atari editor window. I just can't
remember the commands or any other commands.

Does anyone know the origin of Extended Basic for the Atari 800 or have
any documentation of the remaining commands?

I want to say that this was a utility from a magazine but I'm just not
sure. I haven't looked at for 20 years. I only have the one working
disk, no original, no manual

All the searches that I have done have yielded irrelevent hits.
Stephen Sheppard

4126. Tools for creating new disk images on a PC

I'm working on a similar project. As part of the Atari Preservation
Project (http://www.abbuc.de/app/) we designed an open file format
for storing copy protected disks.

So far I've implemented the C++ classes to represent the image
format (including loading/saving files plus a file structure
dumper useful for debugging) and a "1050 emulator" for AtariSIO
(AtariSIO is kind of a SIO2PC for Linux).

The "1050 emulator" still needs some testing, as I'm not quite
sure if I got all the timing parameters right.

A month ago I started writing an imaging tool for the PC but didn't
get too far (ATM I'm quite busy finishing the new TurboFreezer).
I concentrated on finding out the sector timing / track alignment, but
the code to read the sector data is still missing.

The current implementation is targeted at 1050 Speedy drives (which
are quite popular in Europe), but with minor modifications the code
also works with Happy drives (both enhancements are quite similar,
I also own a Happy 1050 and our goal is to have a program that runs
with both enhancements).

It would be great if we could work together!

Please contact me by email (my Reply-To: address is valid), an email
to your address bounced...

so long,

Hias

Hopefully I'm not spamming the newsgroups but I think this is on topic:

http://www.particles.org (My classic gaming site) has introduced new forums entitled "Retroputing".

The forums are dedicated towards the discussion of older computers, ie, "retroputing". Though there are many sites dedicated towards conversations and information sharing on the topic of classic gaming consoles, there didn't appear to be much in the way of forums of all old computers - normally sites are dedicated to a single system. I'm hoping to change that and create a bit of a community for all fans of older computers. Hopefully you'll check it out. Thanks for your time!

MINI-FAQ

- The tools run on an Atari 8-bit computer?

No. The tools run in a PC, some require a Happy 1050 drive, but not an Atari computer. An Atari is used only for running images with a SIO2PC cable.

- Are PRO images supported?

No. They are not supported in any way because they are not documented. They will probably be supported when and if documented.

- Is the image format documented?

Definitely yes. They won't be openly published while we are in beta, mostly because they are still subject to considerable changes. But they will absolutely be documented. There are several reasons why the format should be one, but the most important is that public preservation can't rely on undisclosed specs and standards. Those that have heard me talking about this on the ST, already know that this is almost a "religious" issue for me.

- Are weak/fuzzy sectors supported?

Yes, they are fully supported.

- How much time it takes to image a disk with the Happy?

About the same it takes to read a disk with the Happy Backuper software, usually even less. No disk swapping is required of course, and no time is spent writing. So imaging a whole disk is much more quicker than copying a disk with the Happy Backuper. It is even faster when using the more advanced hardware like the Catweasel or the Discovery Cartridge.

- Do I need to use an original Happy?

No, anything 100% compatible is good enough. If you can run Happy software then more than likely it will work with our tools.

- Can I use other drive enhancements instead of the Happy.

Currently only a Happy 1050 is supported. Other enhancements, like Duplicator, Speedy, etc might be supported in the future.

- Can I use a stock 1050?

The imaging tools don't support a stock 1050.

- Can I write back the images to physical disk with a Happy?

Yes, but not every image. The Happy write back capabilities are more or less the same as with the original Happy software. Most of the limitations are in the hardware, not in the software. As a general rule you will be able to write back any disk that the Happy software can copy.

- Can I image disks that the Happy softwate can't copy?

Yes, you can image most disks, even those that the Happy can't copy.

- What is the Discovery Cartridge?

The Discovery Cartridge was the product made by Happy Computers for the ST. As the Happy 1050 it can copy disks that you can't without special hardware. But technically is very different. The Discovery Cartridge is much more powerful and can copy virtually any disk.

- What is the Catweasel?

The Catweasel is a PC card manufactured in Germany. It is not very different than the ST Discovery Cartridge. But it is manufactured still today.

- Can I use the Catweasel and the Discovery Cartridge to write back those disks that the happy can't?

Yes. They use a completely different hardware, so they don't have the limitations that a 1050 enhancement normally has.

- Can I run the images under the popular Windows based emulators?

Yes.

- Can I run the images with a real Atari computer?

Yes. You need a "standard" SIO2PC cable.

- Can I use my favorite SIO2PC software?

Not currently. A mini SIO2PC software is provided with the tools. It is by no means a full fledged program like APE or SIO2PC. I hope those tools will eventually support these images. Developer tools are provided that make extremelly easy to add support for the images.

- Are the tools PAL or NTSC compatible?

The imaging tools don't work with an Atari computer, only with a 1050 drive. The drive is the exactly the same for both systems. So there is no PAL vs. NTSC issue for the the imaging tools.

Every once in a while, I power on my 800xl. Wooooohoooooo!!!!

I use one of those round adapters that plugs into the middle of the 800xl [on the back]. It splits itself into 4 colored lines with RCA type jacks..... Some are audio, some are video.

My video is fine.

I recall either piping the audio to my PC speakers or into my PCs sound card or something....hmmm....

NOTHING IS FRICKIN' WORKING! I'm gonna scream.

The only colored cables I haven't used are black and yellow. And I tried both out to my sound card [audio in]. And I tried both to a pair of speakers AND walkman headphones. NOT A PEEP. Nothin works.

Wha?......WHAT AM I DOING WRONG? This worked the last time I set it up.....9 months ago or so...

-thanks

image,
> is called IMAGEMAN. There may be others.
> Russg

I'm still working on copying my data and programs to the PC. I keep
getting distracted with other things but I'll get there.

I use my old fav PKXARC (MS DOS) for ARC extractions. I hooked Winzip
to this utility for easy Windows use.

Found a good utility to make ATR files. Coincidentally it's named
MakeATR, a nicely done Windows utility. Will create standard size SD,
ED or DD images or custom sizes up to 65535 sector, with Atari DOS,
SpartaDOS, MyDOS, or DOS II+/D formats. You can add, subtract, and
extract individual files. Very easy to use.
Once again, thanks to everyone for all the help.

On 07 Dec 2004 at 10:43:41 GMT, Larry White scribbled:
->I think that I recall an earlier program that largely dealt with
->Alan Turing and his code-breaking "bombs". Does anyone remember
->this episode?

There've also been PBS programs along these lines. In the Nova series there was "Codebreakers," which aired on my local station on January 18, 1994. I think there was some mention of the Enigma codes in the Nova program "Nazis and the Russian Bomb," shown on February 2, 1993. Possibly also in the Nova programs "Subs, Secrets & Spies" of January 19, 1999; and "Secrets, Lies & Atomic Spies" of August 30, 2003.

There was also a biographical play that appeared on PBS a couple of years ago. Major city libraries would have tapes of these programs, or they could be ordered from the PBS catalog.

On Fri, 04 Dec 2004 at 05:09:02, Greg Goodwin scribbled:
->Corrections to the ... list appreciated!

Listings included:

->Active Atari computer user groups with which SPACE exchanges
->newsletters:
-> * Indiana-Michigan Atari Group Exchange (IMAGE) (South Bend,
->IN)
->
->More active North American Atari computer user groups:
-> * Atari Computer Enthusiasts of Columbus (ACEC) (Columbus,
->OH)

I don't know about the other clubs that were listed, but when-
ever I've come into contact with people in these groups during
recent years all I've heard is that several of the most active
people are still in touch with each other, but that's all there
is to it.

The Columbus group still runs its annual swapmeet but I don't
think there've been any club meetings for some years. BTW, I
heard a report that attendance was down at this year's swapmeet.

In other news (or olds), the Cincinnati club had started a
"newsgroup" on Yahoo several years ago but the last time I looked
there it was no longer up. There hadn't been any messages posted
for years so it was dead, anyway.

Thanks, David! I'll check into the Nova archives. I keep toying with the idea of writing an "Enigma" simulator for the 8-bit. (But I'm lazy... ;-) I found the code to an Applesoft version, but it appears not to use any special graphics, so I think I could improve on that a bit. Then it would be cool to write a "bomb" to break the codes of the "Enigma". Whew! That sounds like work! P.S. -- That is a really neat return address -- "8-bitter@8-bit.old.folks.home".

ACEC were "still kicking" as they put it, when I last heard from them in
August 2002, just over 2 years ago..

Believe it or not, SPACE, IMAGE, and SCAT at least have real, regular
meetings, as evidenced in the club newsletters. Hopefully there are more live
clubs still, even if they don't publish newsletters.

I guess no one here is touch with ABACUS, though, which was what this thread
was going to be about..

4141. RLL Hard Drives with MIO

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-12 17:47:07 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041212124707.08274.00001942@mb-m05.aol.com>
Source record: 13698

Has anyone had any experience or thoughts about using an RLL drive with the MIO? I remember that you can't use an MFM drive with an RLL controller, but I seem to remember that the reverse would work (on a PC). These are cheap and listed as "refurbished" ST-250R.
Thanks,
Larry

4144. belated news on Atari event

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-12 21:57:56 UTC
From: Sid Pacman <8-bitter@atari.universe>
Message-ID: <Pine.GSO.4.61.0412121645150.22349@shell1>
Source record: 13701

Oops! I'm late in clearing out some of my mail files. I just
came across the following report on the swapmeet held on September
11 by the Columbus, Ohio, Atari club. Michael Steve Jr. sent this
news:
= = =

The ACEC swap meet, held on September 11th, went pretty well. It
seemed that the number of people attending was less than last year.
A lot of familiar faces returned. I'd say we had at least 20 people
there, though I don't know the exact number.

There were some interesting things to be found. I believe at
least one Atari Laser printer was swapped at the show. I recall
seeing some Lynx handheld consoles there. A new Suzy B's Software
Atari Software Treasury was available. A visitor to the show also
distributed copies of ARAnyM (AtaRi on Any Machine) for free. A
couple of the re-released atari games on a joystick were plugged
into televisions for people to play with. One patron had a working
STacy with a prototype ethernet card on display.

= = =

My thanks to Michael Steve Sr. for forwarding this info. The re-
port also indicated that there would be a classic computing show
called CCAG 2004 on October 23rd in Cleveland, Ohio. More info on
that show can be found at www dot ccagshow dot com.

I used to use MFM drives on an RLL controller regularly on my old PC 8088 system. A lot of people said I would have problems but I never did. I remember specifically using a Microscience MFM drive on an old adaptec RLL controller on this PC - It ran great for quite a few years. Even had my BBS running on it - FWIW.

The reverse does work but you only get 2/3's of the diskspace usable.

Man this stuff goes WAY back!!!

There was no problem copying the CP/M boot disks. I assume you must be
talking about the terminal emulator for the Atari.

The only thing that I know of that could possibly copy the disk would be the
old CopyIIPC with the option board.
The beginning of the disk was written in Atari format with copy protection
and then the rest of the disk was in a CP/M format.

We were never able to copy the disk, however we did successfully make it
into a Atari executable file.

The way to put floppy disks back in a blank virgin state is to use a magnet
and physically rub it all over the outside of the disk jacket or use a TV
degaussing coil and pass it through a couple of times.

I am not a big fan of emulators, 'cause none of them run my demos. I need the real thing. I do have an emulator installed, but that's just to check out some programs. I need them transferred to disks as soon as possible. I use Atari800 Win Plus 4.0 and that's the one that gets my vote.

I used to get the ST-225 to work with the Adaptec 4000 adapter. Now, I don't get any HD's to work with either of my MIO's.

Hoping for a Black Box setup. Thank you Ben at Bravo Sierra for helping me getting in touch with Bob Puff. I really appreciate that!

How do you cure an 800xl w/ rev. B BASIC?

Is it necessary to swap the ROM with a rev. C ROM? Where can one find these anyway? It must be possible to boot off a disk... can this bug cause programs to crash? I thought it was only in the SAVE/LOAD sequence or something.

Some games run fine on an emulator but don't run at all or have visual glitches on my real machine (note that I am using a SIO2PC cable). I suspect that in the first case, this has to do with copy protection (AFAIK the ATR format does not preserve bad sectors/etc, so why would they run on an emulator and not my real box?) and in the second case some kind of incompability between the 800xl and the older 800/400 machines. I've seen a little program called "translator" to make your 800xl seem like an 800 but I've yet to try it. Is there a list out there I can consult to see which games need this fix.

Thanks,

Back in the days,if an MFM harddrive low level formatted with no bad sectors, I would low level format them with a RLL controller (both Seagate and Western Digital) and use them in PCs with no trouble.

I KNOW...you weren't supposed to do that ,because the drive media wasn't supposed to be stabile at that density,but I did it dozens of time.

Just for a hoot, I just dug out a 286 that I built for my daughter in 1990 (!!!!) using a Seagate RLL controller (ST11R) and a MFM drive (Seagate ST-225 20meg formatted RLL to 32meg and compressed to 64meg with SuperStor)and it booted right up!!! (Wow- remember GEOWorks?)Proof positive that it can be done and that it is stabile. I OBVIOUSLY throw nothing away!

Happy Holdays to All,
Ed

Are the games you're trying to run BASIC games? If they're not, which is likely the case, make sure you hold down the OPTION key while turning on the computer to disable BASIC. Additionally, if these aren't BASIC games, your revision of BASIC in the XL machine doesn't matter. As far as the emulator goes, I use Atari800Win Plus and can set it to either enable or disable BASIC, so with it I don't have to hold down the (equivalent of the) OPTION key. This would be the first thing I would try.

> Some games run fine on an emulator but don't run at all or have visual
> glitches on my real machine (note that I am using a SIO2PC cable). I

With Atari800Win Plus I can emulate different Atari machines. With your emulator, you might want to switch from 800 to 800XL and see if one of these problem programs stop running. Yes, there is a difference in the OS ROM in the XL than in the 800 which causes incompatibilities. The next thing I would try would be to switch my emulator to 800XL mode. If the same game suddenly started exhibiting the same problem in the emulator after doing so I would then know that this compatibility issue is what is causing the problem. MOST of these types of programs can still be run on the 800XL with the Translator disk you mentioned. As I understand it, this disk contains the OS ROMs for previous machines - one side for A and the other for B. There are a few titles which simply don't work on the 800XL, but I haven't run across any yet.

This problem could also have something to do with the difference between NTSC and PAL monitor output formats. The emulator may allow you to choose, while the physical machine won't. Make sure you have the correct version of the software for your hardware.

> I suspect that in the first case, this has to do with copy protection
> (AFAIK the ATR format does not preserve bad sectors/etc, so why would
> they run on an emulator and not my real box?) and in the second case

Correct, ATR images cannot emulate the type of copy protection which uses these types of sectors. If the program runs using the emulator, in the same mode as your actual computer, it should run fine on your computer using the

SIO2PC interface. This doesn't sound like a problem with copy protection...

Let us know if you're able to get anywhere with this!

Sean

I am making a serious attempt to get a HD working with my ATR-8000. The docs mention a disk which accompanies the HD interface. I do have a bootable disk called "CP/M Update with Hard Disk Utilities" but this disk does not include several files mentioned in the docs that are supposed to be used to set up the hard drive. HARDDISK.SYS is one of them. Another is SET.BAS (which sets up the drive parameters in the ATR so the ATR can find data on the HD).

If anyone has any info on this subject, I certainly would appreciate hearing from them.
Thanks,
Larry

Temple of apshai crashed to the BASIC prompt and typing LIST seems to
give me the source, which implies it's written in BASIC. Maybe this one
needs the translator disk. I'll try later.

Ok. Well so far under Atari800Win Plus 4 and Atari800 (unix) the games
work flawlessly and I've only ever used 800xl roms on them.

I realized this the other day. It _was_ in PAL but I switched to NTSC
and games
are still runnning fine.

I cracked open my case earlier tonight and ID'ed all my chips. All NTSC
AFAIK. It's really nice under the hood :) Everything is socketed!
drool I want to mod it to hell!

Er.. turns out the ground connector on my SIO2PC cable wasn't connected
properly. I imagine a substantial amount of transmission errors crept
through it!

Well, that's that. I did enjoy learning about all kinds of copy
protection schemes and ways to defeat em though. What a vibrant scene
the 8-bit atari once was :)

Yes, that's the one. They appear active from the web site.

They also appear to publish a newsletter still, based on the web site.

I was really just hoping to establish a newsletter exchange between them and
SPACE (as SPACE currently has with IMAGE and SCAT), but I've been unable to
make contact with ABACUS. I haven't tried calling the phone number. I
thought I'd try asking about their status here.

Nope, still in beta... And yes, it has been in beta for a billion years.
But one can't really complain about something one wasn't asked to pay for.
Though A8W+ is certainly WORTH paying for. VMware - $200... A8W+ - $0...
:)

4166. XL/XE Autorun Translator

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-16 14:50:22 UTC
From: Gork <nokraygienspam@hotmail.com>
Message-ID: <10s3856imphk9f5@corp.supernews.com>
Source record: 13723

I just found an XE Translator disk which includes ROM A, ROM B and ROM XL on it. I had to clean the ATR up a bit, but you just boot the disk and plug in a number to choose which version you want. I tested it on a few older programs and it works GREAT! In fact, it works BETTER than what I've been using.

That's the exciting part of my post, the rest is a question. :) Does anyone know of a translator which works "in the background?" I have a program file I want to put on a disk which requires Translator A to run. I want something that will allow me to boot the disk to the Translator then pass control to the COM program without having to press OPTION or SELECT or whatever. Make sense?

Well,
you know a story like this: "...many many years ago... in a different universe..." Ok, the ABBUC regional group ARGS (Roland Buehler) once did a cartridge board that had space for three carts and a cable that was put into your cart. slot. So, with the use of this board, one could turn one cart slot into three. Alas, most carts did (and still do) not allow to use other carts at the same time - and those that did/do, like SDX and others, are built in such a way, that one can create small "towers" (one cart sitting on top of another)... So, in the end almost no-one bought this ARGS cart board and of course they produced it only for a very short time...

Alas, I am not sure if ABBUC has schematics for this cart. board - and yet I wonder is there really a need to have more than one cart slot...?!? -Andreas.

Well,
did you use a sector / disk editor to scan the disk sectors ?!? If so this would normally show all available commands at some sector(s). Many disk / sector editors allow searching for a string, so type in DIR and search that string in ASCII or internal code. when found, look if there are other words in the same sector (or +-1 sector) - these are the available commands.

Some extended or enhanced Basics also have a built-in help routine, you have to type HELP (or use the XL/XE HELP key) or sometimes -? to get an overview of all available commands... -Andreas.

I'm not familiar with the XE Translator disk you mentioned, but I'll
stab in the dark and suggest seeing if MyDOS could help.

Instead of using "AUTORUN.SYS" for the file to get executed at boot,
you use "whatever.AR0" through "whatever.AR9", so you could set up a disk
with:

TRANSLTR.AR0
SOMEGAME.AR1

and it would run translator, and then 'some game', in that order.

Of course, if the translator you have REQUIRES some kind of user input,
then this wouldn't help at all. (I'm not 100% sure whether you meant
this by 'option or select' up above.)

Gotta run. Good luck!

This is just a utility, a plugin if you will, for Atari Basic. It's nothing like the Extended Basic 1.0 for the Tandy Color Computer and others which added extensions beyond Dartmouth BASIC.

The Atari utility adds functionality to the editor environment not the actual Basic language. The commands include QREF (lists all of a program's variables), XREF (Cross reference of those variables), RENUMBER (an obvious feature that Atari Basic lacked), DELETE, and REPLACE.

Replace is not very flexible as it can only change a variable's name. It can't be used to change anything else.

"Extended Basic" also adds a handful of DOS functions. This is useful because jumping to the DOS environment on the Atari 800 wipes the Basic program from memory.

That was always a problem, but a number of work-arounds were developed. "MACRODOS" worked well, but Dave Small's "SWAPDOS" (Creative Computing, June, 1985) was my favorite until I got a 130XE with Dos 2.5. I never had a lot of patience for typing things in, but this was short, and I loved the results!

Hi,

My dad has a bunch of Atari hardware that he'd like to give away to someone who cares about it. I have my own little pile in storage, so I don't need it.

several Atari 800 units, all working IIRC, normal complement of RAM.

1 Atari 400 w/ homebrew aux keyboard. The keyboard is actually pretty good- off an old dumb terminal many moons ago...

Atari AC power supplies

misc Basic carts, probably an Assembler/Editor in there too

850 serial comms unit

several Atari pen plotters

misc floppy drives, 810's mostly, maybe a 1050 in there too

several tape drives

various cables, tv channel switchers

Free, first come-first served. If shipping is necessary, I'll box the equipment and ship it if you pay the shipping cost.

Replies by email.

Thanks!

Greg Menke

Extended BASIC doesn't work under Atari800win 4.0 beta which is annoying (but at least I can Save States). Does SWAPDOS work with Atari800win? with the Atari 800 OS ROM?

I want to tinker around with programming the Atari again (after 20 years). I'm beginning to remember the frustrations.

OT:

I own a genuine Action! cartridge (ver 3.6). Can this be dumped to a ROM file usuable by Atari800win? How? I'll be getting an SIO2PC cable soon if that will help.

Andreas Magenheimer <magea000@students.uni-mainz.de> writes:

> afaik there is already the Atari Preserving Project (APP)

I have (or should I say, I had) no relation with APP and my tools don't work with ATP files. As a matter of fact I wasn't aware about APP until receiving some replies to my post. But Matthias from APP contacted me. We decided with Matthias to go along with my project, which is in a much more advanced stage than the APP/ATP one (Matthias, please correct me if I'm wrong). This is perhaps not the official APP statement, as according to him he is not the project leader. But I understand he is the only APP member that made any actual code regarding ATP files.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

USB would be good for all things I'm guessing... If the Atari memory can handle the drivers all at once for ethernet, keyboards, mice, storage... I guess if anything can supply multiple ports it would be USB.

4193. New location for Thursday and Sunday morning Atari Chats

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-19 01:23:43 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <BDEA3441.10C92%drclu@swbell.net>
Source record: 13600

Due to a couple of things, but mainly the fact that I like a chat room
that my Atari 800 can reach with simple telnet and IceT... We have opted to
move the Thursday and Sunday morning chats to atarinews.org... Details
below.. Hope to see you there tomorrow..

Doctor Clu
@}>--'--,----------

Thursday 8:00 pm - 10:00 pm CST
Sunday 10:00 AM-12:00 PM CST

This event repeats every week.
Event Location: telnet:://www.atarinews.org
Notes:
Thursday night chat at the Atarinews.org chat room:

In order to be in the chat for Atarinews.org you have to telnet into it, Use
"bbs" for both the login and password.,If you haven't done it already, type
"new" at the userid prompt and pick yourself out a spiffy userid
and password.Please note that you'll still need to login as bbs even though
you've now got a userid.
Once you've picked out a userid and password, you can use it to enter into
the bbs system. Once you're "in", hit < Return >.
From the main BBS menu simply type the letter "T" and then the letter "C".

Not having much info either, I suspect it was a daughter board that plugs between the cpu and main board.
But, can you have both hard drive and Copower board in at the same time I wonder.

Hi,

I can't get APE/Prosystem to work on my laptop (Evo N410c) which is running XP with SP2. It doesn't think anything's connected.

I've tried obvious things such as turning off the firewall, but no luck.

I've tried the cables on another laptop running Windows 2000 Professional, and everything worked fine.

Does anyone know if there is an issue with SP2, or any other suggestions?

Thanks,
John

> I can't get APE/Prosystem to work on my laptop (Evo N410c) which is running XP with SP2. <

I've had video card issues with SP2, but APE continues to run fine, except of course, it still can't print to my PC inkjet. (But that's always been the case with XP.)

It is interesting, though -- I have an older laptop, a P3-650 MHz running W98 SE. I can actually hear from the SIO sound how APE runs more smoothly on it versus my Win XP desktop running an AMD 3000+.

Something "new" to check out: A small gallery of what are surely some of the earliest print ads by Atari for the 400/800 computers. Including two pages that appeared in the January 1979 issue of _Merchandising_ that I found particularly interesting.

Here's your URL: http://home.earthlink.net/~hunmanik/atariads/gallery.htm

This is my first use of my new, ultra-cheap Visioneer OneTouch 7100 USB scanner, so any complaints about the scanning technique, keep that in mind. :)

Yes, both can co-exist, an in fact the co-power board/MS-Dos can use the HD, according to the docs.

If anyone wants a photo, send me an email for an attached reply.

I may put one of these up on eBay...

NEWS & OPINION

Product review: Atari Flashback versus Commodore 64 30-in-1

The popularity of "TV games" -- the usually battery-powered class of
devices with a fixed number of built-in videogames that plug directly
into the inputs of a television set -- has exploded over the past
couple of years. TV games have a simple plug-and-play appeal and an
impulse-purchase pricing point. The obvious mass appeal of these
devices has manufacturers looking for ways to either out-do each other
in value or to appeal to niche audiences with nostalgia. Two of the
latest, the Atari Flashback and the Commodore 64 30-in-1, accomplish
each goal with varying degrees of success.

Atari overview

The Atari Flashback comes in a colorful, oversized box, but the system
itself and the two detachable controllers are surprisingly tiny. The
console is about the size of a modern phone answering machine and
features a nice selection of 15 Atari 2600 games plus and five Atari
7800 games. The 2600 games are Adventure, Air-Sea Battle, Battlezone,
Breakout, Canyon Bomber, Crystal Castles, Gravitar, Haunted House,
Millipede, Saboteur, Sky Diver, Solaris, Sprintmaster, Warlords, and
Yars' Revenge. The 7800 games are Asteroids, Centipede, Desert
Falcon, Charley Chuck's Food Fight (originally just called Food
Fight), and Planet Smashers.

All 20 games are Atari properties, so no other manufacturer is represented in this collection, and most are easy to find for their original consoles. The exceptions are Sprintmaster and Planet Smashers, which are both notable for being among the last games officially released for their platforms, and Saboteur, the technically unreleased game from E.T. and Yars' Revenge creator Howard Scott Warshaw (although copies were available at last spring's PhillyClassic 5 event). It's also notable that the Flashback was created with the help of Curt Vendel, the well-known Atari historian (visit his site at http://www.atariage.com).

It is important to note that while the original Atari 7800 had superior visuals compared to the Atari 2600, they both shared the same sound chip. In fact, the Atari 7800 was almost completely backwards compatible with the Atari 2600, hence the logic behind modeling the system design on the 2600's lesser-known sibling and including games for both.

In a rare move for a TV game design, the Flashback does not have the ability to run on batteries, only with the included AC adapter, limiting its portability. After plugging in the AC adapter, the composite video and mono audio cables, and one or two of the joysticks, the unit is ready to be powered on. After a short introduction screen, the game selection menu is displayed. Any of the alphabetically listed 20 games is selectable, as is a brief Atari history. The included instruction manual does a nice job of explaining the operation of the unit and how to play each game.

Holding the diminutive joystick in your hand, against all logic, the first thing you'll notice is how well it seems to fit. Unlike the Atari 7800's somewhat bulky controller, the Flashback's feels just right. Also, unlike the 7800 controller's awkward stick and stiff fire buttons, the Flashback's is highly responsive, which is practically a revolution in the world of TV games, where overall controller quality is often overlooked. Even games that originally required Atari's paddle controllers, like Breakout, Canyon Bomber and Warlords, work as well with the included controllers as could be reasonably expected with a joystick, except for the paddle's unique ability to accelerate quickly. (Despite the joystick connections externally looking the same as the original systems, the internal wiring is different, so the included controllers are the only option.)

One upside to the proprietary nature of the controllers is the fact that the pause select buttons are now on the front of the joysticks rather than the console itself. The rest button makes you reach for the main console, but at least that way you can't cancel your high-scoring game by accident while playing! Finally, unlike the standard single-player nature of other TV games, the Flashback's allow authentic multiplayer gaming for every game that supports it, except for Warlords'' unique ability to originally support four simultaneous players with two sets of paddles.

Where the Flashback fails is also where other TV games fail -- the quality of the emulation of the original system's abilities. Whether it was the rumored short development cycle, insufficient processing power, or some other reason, these games are markedly different than their original 7800 and 2600 counterparts. The Flashback version of Asteroids, for example, has washed-out colors, elongated (almost oblong) asteroid graphics, and poor sound. Add to this the fact that the player's ship moves too fast and the asteroids move too slow, and you have a recipe for disappointment whether you're aware of the original version or not. The Atari 2600 games on the Flashback seem to fare a little better, but overall the presentation of all the games leaves something to be desired.

Commodore overview

The Commodore 64 30-in-1 Classic Plug & Play Video Game (or simply Commodore 64 30-in-1) comes in a pyramidal plastic housing for packaging. The instruction manual isn't as detailed and glossy as Atari's version, but then again, Atari is a bigger company and has more resources for such things. Nevertheless the C64 manual describes the system and games in sufficient detail, albeit in very tiny print.

The 30-in-1 runs exclusively on four AA batteries which makes it more portable than the Flashback but requires the use of a screwdriver to access the battery compartment. That's not a bid deal though. (As with the Atari's reset button location, you could even argue that the screwed-on cover vs. a standard slide-off cover is actually a good thing, since a player can't accidentally slip off the cover during intense game play.) After placing the batteries and connecting the included composite video and mono audio cables, the unit is ready for action.

****
[...Continued]

When the 30-in-1 starts, after a few credit screens, the Commodore 64's familiar blue basic prompt screen appears and the classic Load"*", "8,1', and 'Run' commands are automatically typed and executed. This is where you have the epiphany: it's not emulation inside; there actually is a real Commodore 64 coded inside! (The possibilities for hackers are endless and there is a whole web site devoted to this subject at http://www.dtvhacking.info - there are details of how to add keyboards, drives, and other joysticks, and how to find Easter Eggs, etc.) However, as cool as having the "real" C64 inside is, after a while it does get annoying to have to wait for the screen just to change the game selection.

The game choices are Bull Riding, Championship Wrestling, Cyberdyne Warrior, Cybernoid, Cybernoid II, Eliminator, Exolon, Firelord, Flying Disk, Gateway to Apshai, Impossible Mission, Impossible Mission 2, Jumpman Junior, Paradroid, Pitstop, Pitstop 2, Ranarama, Silicon Warrior, Speedball, Summer Games, Super Cycle, Sumo, Surfing, Sword of Fargoal, Tower Toppler, Uridium, Winter Games, World Karate Championship (versions A and B), and Zynaps.

Technically there are 30 games, but some unusual decisions were made to reach that total. Bull Riding and Sumo are events from within World Games, and Flying Disk and Surfing are events from California Games. Neither World Games nor California Games are included in their entirety, but Summer Games and Winter Games are. There are multiple versions of other games. Regardless, it's an impressive number of games for a device of this type.

The controller itself is self-contained with all functions on the same device. There are two large main action buttons (C-64 joysticks only always had one), a smaller reset button, and four auxiliary buttons, labeled A-D, in order to replace the C-64's keyboard functions for certain games.

When the game selection menu appears - in what is surely another nod to original C-64 fans - the list of games appears on a moving star field with energetic background music and scrolling credits at the bottom, bringing to mind the demo screens pirates and hackers of the day would develop to try and outdo one another in demonstrating their mastery of the hardware.

If you're familiar with the original games, you may be surprised at what appears. For instance, with Impossible Mission, after the title screen, the famous elevator sequence displays with your nemesis Elvin's voice saying, "Another visitor. Stay a while, stay forever!" What's surprising is that everything looks and sounds almost exactly like the original, certainly better than any other TV game to date. A sure a lot of this has to do with Jeri Ellsworth's (creator of the CommodoreOne Reconfigurable Computer at http://c64upgra.de) intimate involvement in the project, since it was one of her goals to

accurately recreate the C-64 on modern hardware. Based on the accuracy of the emulation in this low cost consumer product, that's a realistic goal.

With a large and diverse selection of accurately presented games, what's not to like? Unfortunately, a classic TV game Achilles' heel has found its way into the 30-in-1. The control stick, the heart of the unit, has too much "throw" (the distance the stick has to travel to interpret a direction) and does not accurately register directions. For example, in Sword of Fargoal, moving diagonally, left or right, up or down, was often an exercise in frustration as the character would be moved left into a wall rather than up as intended. This movement inaccuracy is present in every game, though some games are slightly more forgiving of this flaw due to their basic design, such as the racing game Pitstop. In light of all the good things about this unit, including the action buttons, this is a serious let down.

The results

The Commodore 64 30-in-1 is available exclusively from QVC (http://tinyurl.com/3nond) and is priced at $30.00 for one unit or $52.00 for two. See here (http://www.mammothtoys.com/products.htm) and here (copy and past the link so it doesn't break -- http://www.commodoreworld.com/Site/DesktopDefault.aspx?tabindex=5&tabid=45&itemid=2&sitemid=9&prod=17&cat=1). Meanwhile, the Atari Flashback is available at many major retailers (ours came from Game Stop) and priced as low as $39.99. See the details at Atari's site here (again, we suggest copying and pasting the link -- http://corporate.infogrames.com/corp_pressreleases.php?op=story&sid=548).

Price: The 30-in-1 is at least $10 less, but also lacks direct support for two simultaneous players that the Flashback has. Winner: Draw

Number of Games: The 30-in-1 has more games, even though it's debatable if there are really 30. Winner: Commodore 64 30-in-1 (We didn't judge the actual game selection, because that is highly subjective, considering the huge amount of games ever made for the original systems.)

Features: The Flashback features detachable controllers, AC power, and two player simultaneous support. The 30-in-1 features an all-in-one unit, battery power, hidden content, and the ability to hack the unit for expanded functionality. Winner: Commodore 64 30-in-1

Playability: The Flashback features a simple and quick-to-access menu system and excellent control. The 30-in-1 has a slow-to-start menu and poor directional control. Winner: Atari Flashback

Hardware Construction: The Flashback, despite its small size, feels solid and works well. The 30-in-1 feels solid but the control stick lacks precision. Winner: Atari Flashback

Graphics and Sound: The 30-in-1 emulates the original games almost perfectly. The Atari Flashback fails to properly recreate the graphics, sound, and speed of the original hardware. Winner: Commodore 64 30-in-1

Overall: The 30-in-1 contains almost 30 full games whose depth benefits from originally being on a game-centric computer. The Flashback contains 20 full games that err on the simple pick-up-and-play side as befits their console origins. The Flashback supports two players at once on certain games, while the 30-in-1 does not. The 30-in-1 will be of particular interest to those who wish to hack the unit. The major downside to the 30-in-1 is the control stick, while the major downside to the Flashback is the emulation.

Final Verdict: While the Flashback controls better, the actual games are so poorly implemented that much of the fun is diminished. However some customers may find the Flashback's games more familiar. Alternately, the 30-in-1 controls poorly, but the games are presented basically as they were meant to be. With more games that are rarely available elsewhere and a price point that's at least $10 less, the Commodore 64 30-in-1 wins this review over the Flashback.

(Please see our web site, http://news.computercollector.com, for pictures of both systems.)

Help from anyone who has run this great game

I've loaded an Atari emulator on my PC - all OK - but when I try the game -

- I have difficulty controlling the cursor - it jumps all over the place

- to get any sort of control - I have to select a joystick as the mouse input device (despite using only a mouse) then the cursor moves very slowly - but I am unable to issue orders to any units

any ideas anyone !

I know this question has been asked, but all the threads I have found are a couple of years old. Anyhoots, I have been using the Atari800win emulator to play around with the old Atari. I found the awesome Atari Archives site, and have been doing some reading on assembly. I have found the MAC65 assembler out on the net, but it does not have BUG65 with it and I can't seem to find it. Also, I found a version of Assembler Editor, but it does not seem to be the original, as it has some disclaimers at the beginning as well as does not match up with the book at all. I guess what I am asking, is there anyone out there that has these program(s) that work with Atari800win???

Thanks for the time.

I own an OSS Action! cartridge (ver 3.6) but my Atari 800 is on it's last legs. How can I dump the cartridge to a ROM file, a binary file, or produce an ATR image that I can then use in Atari800win (4.0 beta)?

Alternatively, where can I download such a file? I repeat, I own an Action! cartridge (which I purchased some 20 years ago).

Not that I'm aware of, besides reading documentation for them. Either
should run fine for you in the emulator.

As opposed to say, The Timex/Sinclair .... which made a horrible
paperweight -- though, to give credit where it was due, it made a
wonderful door stopper.

Slor,

Thanks. I got it.

I can't tell which version this is. Displaying $B000 from the the
Action monitor yields $0102 which doesn't seem to be valid. Could be a
function of being a bin file vs a real cartridge.

Steve Sheppard.

APE and windows XP is a very bad combination. I have had all problems (you know).

Ape won't work on 2 times sio speed at all, and has many troubles with the sio-sync. Unfortunately Steven Tucker doesn't has the problems on his XP system. I think it is strange.

Even stranger: when I run an Win98 emulator on Windows XP ape is working better. But my pc is too slow to run that emulator good enough (VMWARE) so that isn't a solution.

I really hope it will be fixed in the future.
Marius

PCs have become more and more unsuitable for jobs that require bit-bashing
on LPT/COM ports.

They have too much to do, so more likely to miss things happening.

It really needs re-working to have a small micro to do the critical
bit-bashing, and communicate with the PC at a less critical pace.

I took this approach to listen to RDS data. A small Atmel AVR listened to
the clocked bit stream and packed it into bytes to an RS232 stream. Worked
perfectly.

Since RS232/LPT ports are being replaced by USB, I suggest APE upgrades to
use USB.

FTDI make chips that make USB interfacing easier than a UART/MAX232 chip.

I recently added a USB slave port to my own 6502 project, and I can now talk
to it through a virtual COM port as easily as if it were a real COM port.
Easier in fact, because I don't have to mess around with baud rates or RS232
level shifting.

I'm willing to chat with the author of APE, if he is interested.

As I stated I'm not sure of the origin of Extended Basic 1.0. To the
best of my knowledge it was something I typed in from an article I read
20 years ago. If true the source likely would have been either
"Antic", "Analog", or "Compute!" magazine.

All I have is a binary file and a documentation file neither of which
gives any clue to the source/author. All I can tell you about Extended
Basic is it loads as an Autorun.sys file from a DOS disk. There is
also a duplicate file named EBASIC2. If I copy either file to a single
density DOS disk and name the file Autorun.sys then Extended Basic will
boot, ahead of Atari BASIC's "Ready" prompt. If I try to put the same

file onto a double density disk it will not work. If I copy the file from SD to DD and back to SD, well that doesn't work either. Something in the copy process is altering the file.

I suspect this is also why I can't make Extended Basic work in Atari800Win Plus.

Not having an APE/SIO2PC type interface I can only copy the file to the PC via a double density disk. I must use double density disks because PC floppy drives (5-1/4" of course) can't read single density Atari floppies, only double density.

Hmm... I'm not familiar with that. I know about the "Update Speed" selector, and I (sort of) remember assigning a task priority in Win 98 SE, but not specifically what you are referring to. Can you expand that a little. Or maybe this is something from XP Pro? (I have "Home Edition.")
Thanks,
Larry

> use USB.

<etc.>

Ofcourse it is interesting what you are writing. But explain me: why is it
working when I EMULATE windows 98 on windows XP! I'd say if your theory is
right, it wouldn't work at all when I emulate windows 98 on an XP machine
(because in that case there are even MORE things to do)

The problem is the Interrupt Sharing in XP. Due to this NON-REALTIME
connection to the Com port, many problems occur. When that internat sharing
could be disabled and a realtime connection could be forced, everything will
work fine.

There are other programs (like atari810 emulator) that work fine. Even with
1x, 2x and 3x speed.

I hope Steven can get the problems fixed.

Thanks,
Marius

Yes i did, but that won't work. I think the APE program is already doing
that by itself.

But that thought had crossed my mind too.

Message-ID: <41C98A92.780F3EF2@students.uni-mainz.de>
Source record: 13640

Well,
of course I knew it was for the A8. I have approx. 10-12 (or more)
programs that extend Atari Basic in some way or another. Many of these
are just short utilities, that have some kind of built-in help guide
(one has to press the HELP key on XL/XE computers or such). Next, most
of these utilities include the extra commands in the program itself as
plain text, so one can easily use a mentioned disk/sector editor to see
these commands (it is the same with Turbo Basic XL, one can see the
available commands at the end of the program file)... -Andreas.

P.S.: You never used a disk/sector editor to look into a text/gr.
adventure ?!? This is an easy way to find out all available commands
(and sometimes even the solution) and it works with DOS, DUP, Basic,
etc. also...

4234. Re: XL/XE Autorun Translator

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-22 14:57:08 UTC

Message-ID: <41C98B44.D7F964E0@students.uni-mainz.de>
Source record: 13641

Well,
this does not include "Bandits" or "The Tale of Beta Lyrae" where one
still has to use the translator disk. Afaik, most if not all translators
are created in such a way, that one has to press a key (Start, Select or
Option) before booting a new program with it... so *.Ar0, *.Ar1 under
MyDOS does not work... -Andreas.

4235. Re: Extend Basic 1.0 - information wanted

Newsgroup: comp.sys.atari.8bit

Source record: 13642

Well,
afaik some extended Basic utilities use the RAM under the OS, thus they
cannot work with the 800 OS ROM, they require an XL or XE OS ROM...
-Andreas.

4236. Re: 800xl basic rev. b questions, and more.

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-22 15:06:45 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <41C98D85.B04BB295@students.uni-mainz.de>
Source record: 13643

Well,
afaik the most common bug in rev. B Basic, was that it added 16 Bytes (garbage) when saving any Basic program. When loading and then saving it again, another 16 bytes and so on. for a programmer who often saved his work this could be really annoying, since the program would sooner or later lock up. But, since I wasn`t a programmer and my first 800XL had rev. C, I never cared much about that bug.

Besides, in many magazines they had type-in listings to overcome this bug (RevBtoC.COM it was often named on diskettes). I don`t have the program in my collection (since I don`t need it), but I guess it can easily be found on the web (it is also somewhere on the Pooldisk Too)... -Andreas.

In Maryland, we have through the Baltimore County
Library,the Sailor Program.
You can log on (410.494.1199) with any termimal
program,at 300bps(or higher!).It will connect.
The screen will look strange,as it expects 80 col.
and VT100 emulation.
But this will do to test your modem,to make sure it will
connect.

NOW,for the good part:

If you use an Atari 8bit with a term program that
supports 80 columns and VT-100 emulation,you
can connect to the internet,with your Atari,using
the Lynx browser (text only).If your term program
supports the Kermit protocol,you can upload and
download too.

I have done this for over six or seven years,using
the OmniComm term program.I can send and receive
E-mails and upload and download files and read the
web pages (in text only-no graphics).

Until Google changed the format of this web site,I
could read and post here with this setup.

ALAS! No more. This format uses frames,which
Lynx does not support.

I am going to try:

http://news-reader.org/comp.sys.atari.8bit/

and see if that will work with the Atari,as it does not use frames.
Season's Greetings to All!

Hi

I have a Centipede cart with socketed ICs. The cart has 2 chips, 8K each. I want to read the contents of both chips with an EPROM burner. I setup the EPROM burner as if I were to read the contents of a 8K EPROM (27C64).

I'm clear about the Data and Address lines connections, but what about OE (Output Enable) and CE (Chip Enable)? Should I connect both lines to pin 20 (/S4, /S5) of the ROM in order to be able to read its contents?

Regards

PS: I read about 2600 carts using A12 as an Output Enable...

I'm afraid this question is going to show just how "Atari slow" I really am, but here goes anyway...

Is there a utility I can use to create a binary file, loadable from DOS or one of the many menu driven autoboot menus available, from a ROM cartridge dump? Specifically, I just used Cartridge Dumper 2.0 and dumped the ROM of a game I own, K-Razy Shootout. I can now use the ROM image in an emulator and it works perfectly. At this point I'm trying to somehow convert it to a file which can be placed in an ATR image (or on a floppy) so I can run it on my REAL 130XE.

I realize there are images available and I don't need to go through all this, but I WANT to... Call me weird... :)

Source record: 13553

I have done a lot of modeming,with various combinations of
modems and terminal programs,and have never been able to
connect to any BBS above 2400bps.

I have been using an 850 for serial I/O.
I can null-modem between two computers at 9600 but not connect
to a BBS.
A while back I read an article in the OHAUG archive,
by Alan Sharkis (a real nice guy)that mentioned that one
of the RS-232 signals is missing on the 850 and,as a work-around,
you could modify the modem initiation string and it would connect.
Unfortunately,I can't find that article!
Does anyone have any ideas about this?
If you can connect to a BBS,with only Atari equipment,at 9600
please share your method with me.

Thanks

Uhm...
Here goes...
There may be a utility that makes a binary load out of your ROM dump, I
dunno.
To hack it yourself. Uhm.
First make a binary load file that moves the display list down under A000.
You'd put a AO in RAMTOP (decimal 106, I think). Then set up a IOCB for
either E: or S: and CLOSE, OPEN, CLOSE it. That'd move the DL and screen
memory so you can load your ROM dump. Now, you gotta put a load address in
there, so the file would have a 00,AO,FF,BF and then your ROM dump. Then
you gotta look in BF?? (I forget) for the init and run addresses of the ROM,
and finally put the init (2E0, 2E1,HI,LO) and RUN (see your Mapping the
Atari, right next to or actually 2E0, 2E1.
Then you'd have to do some serious hacking and find the copy protection that
sees if an address from A000 to BFFF changes when a byte is stored there,
and maybe some other copy protection routines of commercial carts.
I used to use OMNIMON and dump A000 to BFFF, this is for non-bankswitching
carts, which your K-Razy shootout might be. But you already dumped it and
it works fine in emulator. Good Luck.

Oops I forgot, your load file needs a FF,FF at the beginning, before the load address of your DL moving routine. All binary load files have to have this FF,FF. Your file would have to load the DL mover, INIT, then load the dump. Maybe INIT again, and finally RUN at your RUN address you got from BF??. (Too lazy to look up the BF?? RUN address for carts.)

I have a original disk of A.E. from Br0derbund, (c) 1982. Does this game only run on the Atari 400/800? I cannot get it to run on the 800XL or 130XE!

Tim

You could try a translator disk, you can download from ftp.spudster.org
It might be your disk drive, some drives just won't load some commercial
games. Or the disk just may be bad. You can probably find the game also at
the spudster site. With the translator and 800XL/130XE, you'd have to hold
OPTION. You are holding OPTION? That is if it isn't a BASIC program.

This is the real deal!

A *very* professional made interface to connect a modern IDE
hard drive to the Atari 8bit.

Jerzy Dudek is pretty well known in the european Atari community
and is a good guy.I have corresponded with him quite a bit,and
he is friendly and answers his E-mails promptly.

Don't be worried about ordering from Poland,I had no trouble
receiving my shipment.

I ordered one from Jerzy and,allowing foe time for shipment from
Poland,received it pretty soon. It comes with a printed manual,
setup software on a floppy,and a CD of Atari programs,many from
Europe.I haven't had time to set it up yet,but I am very pleased
with what I have received.

When I get it up and running,I will post a review here.

Happy Holidays to all!

While I DO have OMNIMON, owning it and being able to use it are two different things. I spent a good chunk of time on it encompassing many hours yesterday in an attempt to do what you're describing but with no success. I've not worked with this type of stuff before and it is, frankly, way above my head. I printed up your messages, though, so that as I continue down this learning path I might be able to use it.

That said, I was mainly looking for a utility that would dump the cartridge to a binary file. Yes, I did use "Cartridge Dumper 2.0" to create a ROM image which works fine in the emulator when loaded as a cartridge. I also was finally able to get a binary image dumped using both "Cartrdige Copier" and the tool on Scanalyzer, but I had to downgrade to OS B to get it to work, for some reason. (Maybe just chance, I don't know.) The resulting binary file loads fine to the starting screen of the program, but when I hit START to begin a game the screen goes completely blank. Would this signify the copy protection techniques you were describing? If so, trying to do this is going to be an effort best tried further down the line... I need to start with smaller potatoes and work my way up! I'm only doing this as a learning experience, not because I need this game to work on the emulator or whatever...

Well, I do know that shootout does run from a binary image on the
Atari. I know this becuase long time ago I dumped it onto a cassette
tape and managed to boot it from tape. I can't remember how I did it,
but it worked. Another thing that can be done is to split track Star
Raiders, and have the Star Wars theme being played over the TV speaker
while Star Raiders boots from tape. Cool huh?

I'm not familiar with the three programs you mention, cartridge dumper,
cart. copier and scanalyser.
I wrote, or copied the commands for use of OMNIMON, I'll probably send you a
copy. You mention one of your programs made a binary load out of the cart,
but it freezes on you, and you have to use OS B to get it to work.
Many of the old 'hacking' tools require OS B, because they were written
before the XL/XE machines and didn't follow good programming practice of not
jumping directly into OS routines.
So, I can't help you with your quest, except to tell you a little about
using OMNIMON.
You can plug the cart in, then hit RESET and SELECT, I think to get into the
monitor. Then you do a command (I don't remember it, it will be in the doc
I send you.) .. a command to dump memory to sectors on a floppy. There may
be a way to dump memory to a file, but I don't remember it. You then have
to move the sectors to a file to get your cart dump. I wrote a program to
send raw sectors to a file to do that. Anyways, I'll send you the doc if I

can fix your reply address.

It's me again...
It wouldn't be too hard to write a program to create a binary load file from a ROM dump. My problem is the INIT in carts. If the cart doesn't INIT, then it would just jump to the RUN address, AND it can't be a bank switching ROM.
Here would be the steps:
1. Put the FF,FF
2. Put the address of the move DL routine, say 00,06:40,06 then INIT (a load INIT, not a cart INIT) E2,2:E3,2:0,6
3. Put the address of the cart, always 00,A0:FF,BF, followed by the 8K ROM dump, which you'd pull in off a file on disk.
4. Now the RUN command E0,02:E1,02:00,A0 (If the cart runs at A000). (you'd get the cart RUN address when you load the dump from file).
That's it. Except I don't know much about the INIT for carts.
But I ramble.

it's been a VERY long time, but I seem to rem it does not work with
the later Atari 8bits. Like someone else mentioned running the
translator disk or XL-FIX should do the trick.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

4260. Atari Flashback vs C64 DTV

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-25 07:53:56 UTC
From: Greg.Goodwin@family-news.org
Message-ID: <baf003.990ebc@fmlynet.org>
Source record: 13571

Typical... Atari vs. Commodore. And the comparison is not neccessarily
cross comparison. The Atari has had the battery powered controller just
like this Commodore device. Also, we are comparing a computer console
to a gaming console. Hardly a fair comparison.

All things considered, the Flashback did great all things considered.

> paper weights. You could power them up and do stuff. Pure genius!

You know in my Atari 800 setup I have a working 800 and 850, and everything else might as well be a paper weight. Mainly I use the shells of other devices to keep with the theme. I have a 835 shell around my Supra modem, and I have a 410 recorder here that is basically a paper weight. And I have a 825 printer I want to throw into the display somewhere... not sure what I will use it for.

And somewhere I have a 810 drive... :)

> How do you go about getting a username/password to log onto this BBS?

Ever been on a BBS before? When I logged on for the first time in like
2000 it was simply a matter of registering the first time you log in. You
can do this by dialing up, (972-496-0650) or by registering at the web
log-in at www.family-bbs.net.

Great service. Has the dialip, telnet (telnet://www.family-bbs.net) and
the web page (http://www.family... yadda yadda)

Let me know if you have any difficulties. I use this BBS for checking the
newsgroups (like am doing now) and for logging on to Closer to Home and
the Boot Factory BBS.

Thanks for the advice. Actual dialup numbers are hard to come by. I am trying to find such services for people to hit the internet as I try to get more and more Atari users and their Atari computers on the net and over to the Atari BBS's!! (Personal goal for 2005 which some of you may have read on Atariage.com)

As for reading this newsgroup, subscribe to telnet://www.family-bbs.net

It is very seemless for a Atari8 to read it here. It is like reading messages in a BBS.

> Thanks

Ed,

Glad to help, since modeming and BBS'ing are 90% of what I do on the Atari 800. And I use 9600 baud daily.

Ok, works something like this... the 850 interface has a different wiring scheme than the regular serial ports of today, but (looking at setup...) yep.. port 1 is what I use. I think I once used port 4 for a printer connection back in nineteententacky, but haven't used that in ages. Never have used 2 and 3. Each have a funky pin out. Hehehe..

But weird or not, port 1 works good with the right cable. I've hacked together some of these, but Rick D. / A8Mastro of "More Than Games" sells a adaptor that makes the right cable, and usually shows up at the Atari Chat on Sunday mornings at 10 am at www.atarinews.org ... com... geezz.. forgot that ending extension. Will advertise the chat later today though, so no problem there.

The top speed, sadly for the 850 is 9600 for a modem connection. There is a device out there that will let it do 19.2K, and devices like the Black Box and Ape connection will let it buffer speeds up to 56K! Mind you, I don't think the I/O port is able to do beyond 19.2K actually, but with external help, it's possible.

What helps with speed is the program. I used to use Express850 in 1986, and I was convinced that my Atari 400/800 could only do 2400 baud unreliably. Well, has all to do with the programming. These days I use

the Atari 800 version of Ice-T for 80 column ANSI, and Bobterm for ATASCII connections. And I am told the XEP-80 allows Bobterm to handle 80 column as well. Can't wait to try that later this week. :) (Just ordered a XEP-80).

And there you go Ed, 9600 baud is there and common on the Atari8.

With that, see you on the Boot Factory and Closer to Home! :)

Doc Clu 800

4265. Re: Cartridge dump to binary file

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-25 13:34:47 UTC
From: Gork <nokraygienspam@hotmail.com>
Message-ID: <10sqr3untapf35c@corp.supernews.com>
Source record: 13572

FWIW, those three programs, Cartridge Dumper, Cartridge Copier and Scanalyzer.. One dumps a cartridge to a ROM image, one dumps a cartridge to a BIN image (by adding the necessary header and whatever) and Scanalyzer is a hex utility, a disk scanner (looks for protection as well), and includes a utility to create a binary file from a cartridge.

Thanks for the info regarding using OS B for some of the old hacking tools - I didn't realize...

GETting and PUTting sectors is something I never did in BASIC when I dabbled in such things when I was younger. All this INIT, RUN and etc by saving bytes to a disk is something which is completely new to me. I am DEFINITELY low on programming ladder, and even lower on the "hacking" ladder... Between your help and a bunch of help from someone met through this newsgroup who contacted me offline I now have a grasp of the IDEAS, though, as well as some Assembly code to analyze and work with. I'm not sure how far I'm going to be able to implement these ideas, but I'm currently mulling them over in my head. From what <big_d_316@yahoo.com> wrote in message news:1103904751.914888.237080@c13g2000cwb.googlegroups.com... concerning their past luck with creating a binary "file" loadable from a program drive from the K-Razy Shootout cartridge, I'm confused as to why the "cartridge dumper" I used rendered a binary file which didn't work properly, though.

So, I'm at an impass. Instead of "publish or perish," it's "learn more or perish!" I have some building blocks now, though, and I thank you.

In the meantime, if anyone else knows of a different utility which might work to do this all at once, do tell, it'd be nice to have that information in addition.

Sean

Thanks for the information... Knowing that it's at least POSSIBLE goes a long way to providing me with the "umph" to continue.

I am aware that the program recorder could play back a sound track while simultaneously loading a data track, but how interesting that you'd create a tape to load Star Raiders while playing Star Wars! Cool, indeed...

You know this review is sickening. I went through a lot of the Commodore vs Atari stuff and I got sick of it. Who really cares about this? Not me. You have not changed my mind at. I am an Atarian and will buy the Flashback and avoid the 30-in-1. I am sure the Commodore people will do the opposite.

boiling the whole time.
Cover the pot and simmer till vegetables are tender
(2 hours approximately).
Continue seasoning to taste.
Before serving, add butter and pasta,
serve piping with hot bread and butter.

Offspring Rolls

Similar to Vietnamese style fried rolls, they have lots of meat
(of course this can consist of chicken, beef, pork, or shrimp).
Who can resist this classic appetizer; or light lunch served with
a fresh salad? Versatility is probably this recipe?s greatest virtue,
as one can use the best part of a prime, rare, yearling, or the
morticians occasional horror: a small miracle stopped short by a
drunk driver, or the innocent victim of a drive-by shooting...

2 cups finely chopped very young human flesh
1 cup shredded cabbage
1 cup bean sprouts
5 sprigs green onion, finely chopped
5 cloves minced garlic
4-6 ounces bamboo shoots
Sherry
chicken broth
oil for deep frying (1 gallon)
Salt
pepper
soy & teriyaki
minced ginger, etc.
1 tablespoon cornstarch dissolved in a little cold water
1 egg beaten

Make the stuffing:
Marinate the flesh in a mixture of soy and teriyaki sauces
then stir fry in hot oil for till brown - about 1 minute, remove.
Stir-fry the vegetables.
Put the meat back into the wok and adjust the seasoning.
De-glaze with sherry, cooking off the alcohol.
Add broth (optional) cook a few more minutes.
Add the cornstarch, cook a few minutes till thick,

The reviewer compares mangos and grapefruits here, because the Atari 2600 and 7800 were strictly games systems but the C64 was a personal computer.

I think the C64 unit is a step forward for items of the type, not only because it's the first computer to be recereated in this form, but also because you're reputed to be able to hack it and add a keyboard and peripherals. I read that this takes some soldering and rewiring and so forth. It would have been really groundbreaking to include a USB port.

If they ever do one of these for the Atari 8bit (and the C64 one has been successful so far evidently, so maybe) then we should all write the manufacturer to ask for the USB port or other expandibility options.

I bought the Intellivision model of these. It was a little harder to find. It's an interesting novelty but I would add the usual criticism directed at these things, that they don't faithfully capture the original games for whatever reason, that the gameplay or graphical or sound elements of the games never seems to be fully baked and that features of the originals seem to be missing.

But It would be most awesome to have a device that essentially recreated an Atari 8bit but added the ability to have today's peripherals like keyboard and CD-R drives and even network gear!

more efficient and inexpensive than buying pieces.

1 tiny human, cut into pieces
2 cups flour
Onion, garlic
Salt
pepper
garlic powder
cayenne pepper
hot sauce, etc.
Oil for frying

Mix milk, eggs, hot sauce in a bowl, add chopped onion and garlic.
Season the meat liberally, and marinate for several hours.
Place seasoned flour in a paper or plastic shopping bag,
drop pieces in a few a time, shake to coat thoroughly,
then deep fry in hot oil (350�) for about 15 minutes.
Drain and place on paper towels.

Miscarriage with Mustard Greens

Why waste it? Otherwise, and in general, use ham or salt pork to season greens.
The technique of smothering greens can be used with many vegetables;
green beans work especially well. Meat is not necessary every day, don?t
be afraid to alter any dish to vegetarian tastes.

1 premature baby, born dead
Large bunch of mustard greens
2 white onions, 1 cup chopped celery
Vegetable oil (or hog fat)
Salt, pepper, garlic, etc.

Lightly brown onions, celery, garlic and meat in large heavy pot.
Add a little water and the greens (which should be thoroughly cleaned and washed).
Smother slowly for at least 2 hours, adding small amounts of water
when it starts to stick.
Stir frequently.
When ready - serve with rice, grilled smoked sausage, green salad, and iced tea.
Coffee and apple pie then brandy.

Maternity Ward Pot Luck Dinner

If you can?t get anything fresh from the hospital, nursery, or morgue;
you can at least get rid of all the leftovers in your refrigerator.

1 - 2 lbs. cubed meat (human flesh, chicken, turkey, beef...)
1 -2 lbs. coarsely chopped vegetables
(carrots, potatoes, turnips, cauliflower, cabbage...)
Bell pepper
onions
garlic
ginger
salt pepper, etc.
Olive oil
butter

Brown the meat a

Dr.Clu you missed the point of this message.

I am familiar with the specs of the 850 serial ports and have made a couple of dozen cables for myself and friends.

I can connect reliably,with a null-modem cable,between an Atari and a PC(or any computer)at 9600bps with a variety of term programs (BobTerm,OmniComm,et.al.)

The problem is with the modems.

The problem is,that I can't get a modem to connect to a BBS (or another modem)at 9600bps properly.I get garbage.

I really believe the problem is in the modem initiation string. Can anyone who connects reliably at 9600bps tell me what modem initiation they use?

Here's some of my old notes:
ATN0 forces rate specification in S37.
So you would do an:
AT
OK (OK should be seen in term screen after each AT command.)
ATN0
s37=9 (for 9600, 8 for 4800, you might want to try 4800 first)
I think you'd do a AT S37=9, I don't remember how to set the S registers.
AT&Q0 (send result codes to the computer, computer and modem same speed)
AT%m0 (turn off compression)
AT&K0 (turn off flow control)
These settings worked for me.
Oh, and if you want to reset the modem to defaults, ATZ.
Most 9600 and up modems will seem to automatically match the computer rate,
I'm not sure.

Oh, also:
I used BobTerm mostly.
You'd have to set BobTerm to ASCII before the AT commands will work.
And set BobTerm to 4800 first, see if that works then try 9600. I think
BobTerm will also go 19.2k, I don't think I ever got that to work.

While I'm at it:
ATZ
AT&Q0
AT&T1 will cause the computer to 'connect' to the modem and tell you the
speed.
AT&T8 is a local analog loopback test.
AT%Q will do a line quality test, should be less than 15, must be <30.
My modem book I'm looking at suggests an init string of:
AT&C1&D2&Q5W1 and I've added E1S95=47.
Instead of me looking all these up, I bet a Google search of Modem AT
commands will let you see all the Hayes commands.

Also.
+++ (3 pluses) will force your modem into command mode when it is
connected to another modem. I think ATA will take you back to term
mode. ATA is 'answer', ATO 'originate' may be the correct on to go back
to term mode. With a ATO, your modem will try to negotiate a connection.
ATA will answer an ATO.
Of course if the other modem isn't set to not respond to +++, it to will
enter command mode, I think.

4279. Modem Connection > 2400bps

Source record: 13586

Thanks Russ,

Again you went to the heart of the problem.

I have several good modem books that contain
the entire Hayes (AT) command set.

I meeded to know where to begin modifying the
init. string to get RELIABLE modem-to-modem
connections at 9600bps.

ATZ doesn't help much,if the modem (bought used)
was last used with a PC. :(

Right now (my busy season), I'm up to my gluteus maximus
in alligators,but after the New Year,I have lots of
things to work on (i.e.,Jerzy Dudek's fine IDE interface)!

Happy New Year to the whole Intel Outside gang!
Atari Forever!

:(Sorry I tried.

As for the initialization string, I asked the same question years ago and
was advised "at&k0" and it has worked like a charm since.

I use Ice-T and Bobterm, but I am on the Atari 800. Ice-T 128K I
understand is woderful if you have a 130 XE.

9600 Baud is the max for the 850 interface.

Well, not quite automated, but it turned out to be one of my easier "catastrophes." All sectors on the disk were OK *except* 360 and 361. So I formatted a new disk (2880 DD sectors) and then sector-copied all the good sector data to the new disk.

Since all of the actual files were in two subdirectories, I found the beginning sectors of the two subd's. and copied the 1st subdirectory sectors to the main directory on the new disk. MyDos ate this right up -- so I could then copy all of the files from the 1st subd. Then I repeated the process for the 2nd subdirectory.

I was able to save everything on the disk -- which was about 2000 sectors of data!
Whew!

-Larry

4289. Atari Flashback vs C64 DTV

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-28 13:53:07 UTC
From: carmel_andrews@hotmail.com
Message-ID: <6912483e.0412280553.12fb1d6c@posting.google.com>
Source record: 13596

The problem with the Atari flashback & the orginal atari 10 in 1 games jobbie is two fold

Firatly, the design concept behind these products mock and insult the idea and technology behind what these productsa are supposed to be 'emulating'

I say this because if you look at the design concept properly, it suggests that the 7800 and 2600 were technologically nothing more then dedicated tv game systems i.e... like the multiple pong game, game systems that proliferated the 1970's, like hanimex, philips and binatone for instance

And correct me if I am wrong but wasn't the idea behind the 7800 and 2600, to advance videogaming from the dedicated gaming systems technologies, in that you could program (as in to plug in a new game rom) the 7800 and 2600 to play differrent games, thus making these systems more advanced then the dedicated game systems they replaced

And yet if would appear that the flashback/10 in one joystick concept, makes the 7800/2600 look no better then a dedicated games system (which clearly wasn't the case) therefore giving the consumer the wrong impression of Atari technology, as before the atari 2600/7800, Atari did very little in the area of dedicated game systems, the only games of note were atari pong (and atari's variations) video pinball and stuntbike are the only ones i can remember

The other problem is the flashback and 10 in one joystick jobbie was that, the marketeers/manufacturer (not ATARI) severely restricted the audience or market for this particular product range, they chose to market it predominantly to the market interested in emulation and classic/retro computers/video games, which, like the way Atari (under the tramiels) and CBM chose to market their products, namely to very small, niche markets, and miss out the mainstream or majority

The last problem with the flashback and 10 in one joystick jobbie was that it's another case of someone trying to cash in on atari's name and making a big bulls up of it, in other words they had/have no credibility in the marketplace, i.e using atari's name and technology and sticking someone elses name on it, which is a bit like asking microsoft to market linux to ms's clients/customers or asking nintendo to market sonic the hedgehog to nintendo customers, theres no credibility in that way of marketing, as you donm't get the same feeling of originality and product use, unlike the original, after all if this form of marketing was successful, why is it that those companies formerly and presently engaged in manufacturing, marketing

and selling 3rd party versions of the atari st/tt and falcon, why aren't these machines selling in the millions, like the originals were... very simply because, it's atari's technology in someone elses box... therefore proving my point

The only way that things like Atari flashback and the 10 in one joystick jobbie could have been successfull, was if they had launched it as a proper console/game system (not as a 'dedicated game system'), similar to the vcsp project of a few years back, and Atari allowing someone else to manuf. it and sold under the atari banner, at least that way, the product would have had more credibility in the marketplace, marketed to a wider audience/market and lastly selling in larger quantities then what the present flashback/10 in one has shifted/sold

Good good!

I have a text file that I was not able to transfer by simply copying.
Sector copying made it possible to copy it, but alas, still cannot be read.
:(It was part 20 of a ongoing series from Atari BBS stories back in the
80's. Hope I can figure out something.

That was Mr. Atari's mod for me. :) There is a website at...

http://www.mr-atari.com/hardware-A800.htm

It was more of a dare. Being the stubborn Atari 800 user that I am I
asked Mr. Atari if he could make a Atari 800 version and that I would send
him a NTSC Jaguar if he did (he wanted better frame rate playing Dragon's
Lair)
In the time he took making the 800 specific version of the MyIde he
could had bought a Jaguar himself, but he did it!

Always love telling that story. Let me know if you are able to make a
800OSCLU version of the MyIde. I think once I make a second one as backup I
will use it more often. It works fairly well, and what is really great is
that since it uses the rom board, it frees up both cartridge ports!

Message-ID: <BDF6E97D.1143C%drclu@swbell.net>
Source record: 13501

I am very new to the printer interface idea. The MPP 1100, the U Print, the ApeFace, the AT Graphics interface... I must have like eight of these printer interfaces, and I have no idea how they work. :)

In the 80's I used the 850 interface or the 1025 printer. I have that and the 825 printers, but I would like to get a printer going that can do some graphics (the plotter doesn't count in my book...) heheheh..

I like the U printer because of the printer buffer and IO port where you can plug in a device through it. This is great since the APE drive setup is a dead end on the IO chain.

My question here is, did anyone make a Y connector for the I/O ports, or does anyone know anything about the U Print A64 by Digital Devices?

Thanks!

I remember the U-Print 64 and the APE interfaces. They were both interfaces
so you could go SIO to Centronics (standard PC printer port). I think the
APE had a port to daisy chain SIO with, ie. you could hook SIO drives to the
interface. No, I don't think there is a 'Y' adapter to allow more than one,
Oh, wait, actually I think Bob Puff made a multiple SIO adapter.
The U-Print wasn't my favorite because it ALWAYS converts 155s to 13/10s, so
you couldn't do any graphics printing with it. The Star SG-10 would allow
you to use either 155s or 13/10s with a dip switch, but that didn't help if
you used the U-Print.
If you're thinking you can print jpegs or something with an Atari, I don't
think such a program exists. Atari graphics printing for like .PIC files
(touch tablet) and .GR9 pictures used the Epson command set for graphics.
Today's printers use maybe postscript or HP PCL language, or I think Windows
has its' own bitmap printing thru the printer drivers for Windows.

Hey, Jim.
I don't know what your W2K server can do, I guess provide a shell connection
for another computer to connect to using a term program. If the Atari term
program has y-modem, then it might work. I'm not sure I understand what
you're trying to do.
If you want to null modem Atari<>PC you can use an old DOS term program,
like Procomm or Telix on the PC. There is a zmodem program for the Atari as
well, I think it is receive only, tho. I used to use Procomm and BobTerm.
There were more than one Y-Modem. I think one was called ymodem-g.
Ice-T may have zmodem. X-modem, I avoided because it added bytes to the
last section of the file. I still have Procomm for the PC, if you wanna try
it, lemme know. Then I think there's a kermit for Atari, I know there is
for PC, I have that too.

With a Lantronix it will work.

But make sure you are connected to a REAL telnet connection. When you are connected with a RAW connection it won't work.

The REAL telnet protocol has a Binary mode (auto set). The RAW connection is ascii only so transfer won't work.

The Lantronix has those two options too. Make sure you use the realtelnet.

Oh sweet lord Atariwriter Plus is crap!!!

If it's not copy protected, then when I finally get past that, it doesn't want to work with APE all that well. Geezz...

All I want is a word processor that will recognize (or can input in) the values to use a STAR SG-10 printer... Or whatever the hell... I love the pdriver.bas .. Which I believe is a Atariwriter utility. But is seems like Atari did everything they could to make Atariwriter user unfriendly.

... Yeh... It's been one of those days... Off... Looking at my Atari and about to scream. Been a good actually.

Ok, anything else out there anyone would suggest that works will with a hard drive system (like APE) and exits gracefully to the dos when done? And one where the printer can be configured?

Washing my hands of Atariwriter Plus...

There were 'drivers' for Atariwriter, never understood what they did.
I think what you're doing is just writing documents and want to do the stuff
that used to be done with printers, underline, italics, bold, dbl. strike.
I think that's all you could do. Except you could do bit-map graphics on
9pin (24pin) printers. I used Paper Clip and it had a config file that
you'd put your printer's codes in for the above mentioned features. I guess
an A8 'printer driver' would be a file that contained the codes for a

particular printer, Epson codes were pretty standard. In some printers, you could set some dip switches or front end buttons to cause the printer to do dbl. strike or bold.
Oh, yes, you could also select the font, if the printer had more than one, and the size of the font, 8, 10, 12, 16 pitch. You could also do proportional printing sometimes. That's all the choices you had, and each one required a set of codes to be embedded in the text to cause the feature, which you'd put into the word processor configuration.
Word processors today are what desktop publishing was, even more. What we called word processors then would be called text editor today I guess.
There were special codes to do bit-map printing.
Are you trying to do some text editing or print pictures?

It looks like MyDos users with hard drives don't backup their drives! ;-) Ok, I'll post for the MyDos camp.

I normally use "The Hard Drive Backup Pro" from CSS and backup from my HD partition to an Atari-based Zip cart. But I have also used the Black Box "Taskmaster" to do a sector copy backup to Zip cart. That really flies!

But as a result of the replies here, I've just tried backing up to an ATR image. I use APE a lot, but hadn't considered using it for HD backups. Thanks for the posts and idea!

Might try Paperclip. I've heard that suggested before.

I would like to text editing.

I would like to make breaktype movies. :)

I would like to be able to print the screen contents using the unique
cartridge "Magic Dump II"... but that one specifically says that it works
with all Epson, Gemini, Prowriter Okidata printers and the N.E.C. PC8023A
printers. I'm told the Star SG-10 is like the Gemini 10X basically, and
under Magic Dump you use the Epson codes for all Gemini computers. But
that is too much of a stretch, and finding one of these printers is a bit
of a stretch/ :)

So yeh, text editing.

Ah, um, I didn't manage to post that message before returning from my
parents' home.
Blasted NTL world would not answer the phone...
It is currently in the heap of things in the hall that I said could be
slung!

I can ring them tomorrow to save it (if they have not slung it already) but
I may not be up there to post it to you until next Christmas.

Then again, after 20 odd years will another one matter much? :-)

Fellow MyDOS user, but I don't backup in a normal manner at all. I'm using 200 meg Syquest drives and when I feel the urge, I take them to the PC and a SCSI drive tester program to sector copy the whole shebang to another 200meg cartridge - 8 minutes total time for that. Then the duplicate cart goes on the shelf. Takes longer to set it all up.

The configuation of the cartridge is such that I can double drive it on the Atari as well and do copies from one partition on one drive to another partition on the other drive, but that happens at Atari speeds so I've never actually done it - just nice to have it such that I could if I ever had to.

And I was going to mention that as far I knew, HardBack was for SpartaDOS partitions only and I thought it only backed up to floppy which is just not going to happen here due the vast numbers of them required. I wasn't even aware that there were non-Sparta alternatives, thanks for the heads up there.

As long as it is SpartaDOS and is addressable as an atari drive (Dn:),
Hardback doesn't care what it is. Of course you don't want Hardback to
format a 16MEG ATR, but otherwise it works great.

Just bought a Defender cartridge on Ebay (serial CXL4025).

Doesn't seem to load up on a 130XE. Anything I might be doing wrong?

Or is it just not compatible?

Are there any sites with compatibility info on cartridges?

Thanks...

I *tried* to put them together like that... The time had come to finally do something with the excess, though, 'cuz after my Atari spending spree I ended up with 50+ boxes all over my livingroom with new (to me) Atari things cluttering all the space not taken up by the boxes! It's MUCH better to be back to "clean and organized." (With the exception of the two big boxes for these two lots still sitting here, ready to be shipped out. :)

4328. Compact Flash Hard Drive?

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-30 12:45:50 UTC
From: llppwhite@aol.comnsp
Message-ID: <20041230074550.07145.00002278@mb-m10.aol.com>
Source record: 13535

Is anyone actually using a Flash Memory Device as a HD with their XL/XE? I have read that the service life is an expected 100,000 writes. (Presumably to the same cells, and probably varies by mfg.) Read/Write speeds would not be much of an issue -- just life, especially to the VTOC/FAT/Directory areas. Still, at 100,000 writes, I would think that would be several years for a typical Atari user.

Another possibilty is the micro-drive. It has some advantages and disadvantages as compared to flash memory -- is anyone using one of those?

-Larry

4329. Want some extra cash, try this

Newsgroup: comp.sys.atari.8bit
Date: 2004-12-30 15:45:44 UTC
From: adamhum@gmail.com
Message-ID: <1104421544.865366.188890@c13g2000cwb.googlegroups.com>
Source record: 13536

want some extra cash, try this

THIS REALLY CAN MAKE YOU EASY MONEY!!
A little while back, I was on my computer having a grand old time, just like you are now and came across an article similar to this that said you could make thousands dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah, right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. No catch, that was it. So after thinking it over, and talking to few people first, I thought about trying it. I figured what have I got to lose
except 6 stamps and $6.00, right? Like most of us I was a little skeptical and a little worried about the legal aspects of it all, So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Then I invested the measly $6.00. Well GUESS WHAT!!?. Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end second week I had made a total over $1,000.00! In the third week I had over $10,000.00 and it's still growing. Its Certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works?.
STEP 1: Get 6 separate pieces of paper and write the following

on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."

Now get 6 US $1.00 bills and place ONE inside EACH of the 6

pieces of paper so the bill will not be seen through the

envelope to prevent thievery. Next, place one paper in each

stating the above phrase, your name and address, and a $1.00

bill. What you are doing is creating a service by this. THIS IS

ABSOLUTELY LEGAL! Mail the 6 envelopes to the following

addresses:

#1) Jason Barone P.O. Box 1015 Glen Burnie, MD 21060-1015
#2) Jonathon Markwood 3308 Birdsong Way Birmingham, AL 35242
#3) Eben Mcgee 1876 #C Locust, Las Cruces, NM 88001
#4) Ricky DeMaio 471 McCutcheon rd, Hudson WI 54016
#5) P. Ortner 29 Briarlee Dr. Tonawanda, NY 14150
#6) O. Humphrey 8452 E. Louise Dr, Tucson, AZ 85730

STEP 2: Now take the #1 name off the list that you see above,

move the other names up
and add YOUR Name as number 6 on the list. STEP 3: Change

anything you need to, but try to keep this article as close to

original as possible. Now, post your amended article to at

least 200 newsgroups, message board. All you need is 200, but

remember, the more you post, the more money you make!----
Just copy this message, paste it in Word or Notepad, find

message boards like this and paste away.

Congratulations? THAT'S IT! All you have to do is jump to

different newsgroups and post away, after you get the hang of

it, and it will take about 30 seconds for each newsgroup! *

REMEMBER, THE MORE NEWSGROUPS OR MESSAGE BOARD YOU POST IN, THE

MORE MONEY YOU EILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF

200* That's it! You will begin receiving money from around the
world within days!

AFAIK you should have no problem. The game should work just fine. Do other cartridges work ok on that 130XE? Can you test the Defender cart on someone elses machine? If the cart works fine on another machine, then the problem is in the computer.

This should give you a starting point to isolate the problem.

Another thing to consider is the cartridge might have some oxidation buildup on the cart connector. Atari used gold plated cart connector most of the time. But they also did produce some tin plated carts and these are more prone to oxidation.

I am giving away a couple of printers for use with Atari 8-bit computers. Both were working the last time I tried them a couple of years ago. Buyer pays shipping. If they are not claimed by Monday morning, January 3, they are going to the dumpster. They are located in Utah, and local delivery is negotiable.

1. Atari XDM121 direct connect letter quality (daisy wheel) printer. Includes spare ribbon.

2. Star NX1000 multifont dot matrix printer. Needs separate interface to work with Atari computers. I have an Ape Face printer interface that could be included for an extra shipping fee.

I know several people are using one with the MyIDE upgrade with an CF-card to IDE adapter. I have been in email contact with a few people who are using one with my MyIDE Image Manager software for that upgrade... so they have it built into their machine with dozens and dozens of games and demos copied to their IDE drive.

I don't have one (yet) though.

And this is what they did wrong with the flashback. They should've
recreated a 7800, put the 15 games on it internally, but also leave
a cartridge slot on it. Add the capability to use paddles and you have
a winner!

I got my C64 DTV, and it is pretty cool. I would love a XL version, but
make it accept cartridges and additional joysticks/paddles. Portable
Castle Crisis would rock (although I did get the 2 player Atari paddle
all-in-one game for Christmas, and it includes the arcade version of
Warlords).

i'm using CF adapter with KMK/JZ IDE interface without any problems.
i've been using CF in my PC for two or three years for storing (among
others) the outlook files (updated many times a day) and never
experienced any problems. i think that atari is a little bit more
conservative about writing than the rampage outlook, so i don't
afraid of anything wrong that may happen.

Greetings, all.

What were the earliest assembly-language development tools available
for the 400/800? Other 6502 computers I've used had some sort of
machine-language monitor cartridge or firmware available prior to
having a decent label-based / macro assembler available.

Did an Atari machine-language monitor cart precede the full assembler?

Thanks!

If I have it right, most of the early assemblers for VCS/8 bits were on DEC mainframes.

That is one of the excuses why we don't have good source listings for various programs/OS anyway. Rumor is one of the first things the Tramiels did after the take over is sell off the mainframes w/o saving the programs.

The first program I remember that was on the 8 bit was the ASM/ED cart. I still have mine and like it for simple assembly programming. It did have a debugger but no macro ability.

There was the MAC/65 and Atarti Macro Assembler that came out later.

I don't have a copyright date on hand but I have used OMNIMON since the mid 80s. I also used TASM macro cross assembler
and really liked it. After getting
used to making a sandwich will my programs went through an Atari assembler it was a pleasure to see an 8mHz '286 spit out the binary in less time then it take to type this.

Graham, that game cartridge should work on a 130XE computer.

You could always try to clean the surface of the cartridge's connector with some alcohol based cleaning liquid. I use alcohol based products made for cleaning windows. Be careful and do not pour liquid on the cartridge or the computer. Make sure it is dry before you start up the system.

Anders

4345. Menus, multiboot, image managers ... ?

I'm happily puttering away with a 130XE and the KMK/JZ IDE interface, trying to load a whole lot of games onto an IDE drive, and I'm curious about a lot of the utilities and DOSes out there.

How do menu makers work? Which ones are compatible with large drives which have multiple MyDOS subdirectories?

What is Multiboot? How do you use it?

Are there any ways to automatically load a bunch of full-disk images (say, as DCMs) into directories on a large partition and rotate them out into smaller partitions to play - in other words, any image managers?

Why hasn't anyone yet written a DOS to support D9: through D15:?

And my 130XE has one odd phenomenon - it will only ever see disk drives on the second try. The first boot always goes to the self test. Then, if I hit option-reset, it always goes to the disk drive and boots properly. This is without the IDE interface in. What's going on? Thanks!

4346. Hot 22 year old uses an Atari 8-bit computer!

Well, I know the 28 year old creator of the C=1 (current Commodore computer) is kinda cute.

I'm sure there are other ones out there. Yeh true we tend to be a 30's and up club, but some people have kids that have grow up and given it a try. I am one of those people more or less. Played games back in the day, but thanks to dad, got the more technical help.

And there are others.

And when you said "hot 22 year old" I would assume you are talking female, though it does not specify. ;)

I wrote one for the MyIDE interface (http://www.mr-atari.com). I have just
completed version 2 and will release it very soon. It does exactly what
you want, albeit for different hardware. :)

>Why hasn't anyone yet written a DOS to support D9: through D15:?

I thought that some version of SpartaDOS did?

Hm, how hard would it be to rewrite your image manager for KMK/JZ?
Anyone? Jerzy?
